# MU Study

Complete Tutorial Series — Easiest to Hardest

Thirty tutorials that teach every layer of the Flutter + Supabase school platform: product, database, auth, Riverpod, go_router, homework, marks, attendance, chat, notifications, themes, localization, testing, and release. Ordered from concepts that need no code to complete features that stitch the whole system together.

| | |
|---|---|
| **Product** | School management + study platform (Math & English) |
| **Client** | Flutter · Dart ^3.11.5 · Riverpod · go_router |
| **Backend** | Supabase · PostgreSQL · Auth · Storage · Realtime |
| **Roles** | Student · Teacher (math/english) · Admin |
| **Locales** | English · Russian · Uzbek (not Arabic) |
| **Login** | Username + password (synthetic @mustudy.internal email) |
| **Registration** | None — admins create every account |
| **Secrets** | Placeholders only. Never paste a real anon key into notes you share. |

*Generated from the inspected MU Study repository and the live PostgreSQL schema. Follow tutorials in order. Type the code. Verify every checkpoint independently.*

# How to use this book

This is a reconstruction textbook, not a slide deck. Each tutorial has a Learn block, real MU Study files, a practical TASK, an independent verification CHECKPOINT, common mistakes, and video links. Later tutorials assume earlier checkpoints passed.

## Learning contract

1. Work sequentially from Tutorial 1. Skipping fundamentals is the fastest way to get stuck on RLS.
2. Type SQL and Dart yourself. Copy-paste only when a lesson says the file is a reference dump.
3. Never commit .env. Never put the service_role key in Flutter. Never invent auth emails in the client.
4. After each TASK, prove the CHECKPOINT without looking at the answer first.
5. When something fails, use Appendix D (Troubleshooting) before changing random code.

## What “complete” means for MU Study

A complete recreation includes: three role shells (student, teacher, admin); username login via get_auth_email_by_username; PostgreSQL enums, tables, views, SECURITY DEFINER RPCs, RLS, Storage buckets, Realtime on chat and notifications; EN/RU/UZ localization; four visual styles; homework packs with tasks; attendance sessions; weighted marks; group chat with replies and reactions; admin mass tools and printed credential slips.

**WARNING — This book teaches the real app, not a simplified fantasy**
Some generic Flutter+Supabase tutorials use public email signup, Arabic localization, or Firebase Cloud Messaging. MU Study does none of those. Login is username-based. Languages are English, Russian, and Uzbek. Notifications are in-app rows plus Realtime, not FCM. Tutorial 20 explains that honestly and shows the real notification path.

**Independent verification**
A checkpoint is independent when you can prove it without the author’s machine: a SQL query result, a flutter analyze exit code, a screenshot of a named screen, or a second account that cannot see another student’s marks. “It looked fine” is not verification.

# Table of contents

| Section | What you gain |
|---|---|
| How to use this book | Start here |
| Tier 1 — Fundamentals | Tutorials 1–4 · no coding required at first |
| 1. Understanding MU Study | Product, roles, stack, architecture |
| 2. Database concepts | Tables, keys, types, 20-table map |
| 3. Supabase project setup | Account, keys, Table Editor, SQL Editor |
| 4. Environment variables | .env, dart-define, Env.sanitize |
| Tier 2 — Flutter basics | Tutorials 5–9 |
| 5. Flutter project structure | lib/, pubspec, platforms |
| 6. Dart basics | Types, functions, classes, null safety |
| 7. Widgets & layouts | Material, Scaffold, forms |
| 8. Stateful vs Stateless | setState and when not to use it |
| 9. Navigation with GoRouter | Redirects, shells, path params |
| Tier 3 — State management | Tutorials 10–11 |
| 10. Riverpod basics | Provider, Future, Stream, Notifier |
| 11. Models & data classes | fromJson, enums, why not Freezed here |
| Tier 4 — Database & backend | Tutorials 12–15 |
| 12. SQL basics | SELECT through JOIN and aggregates |
| 13. Supabase authentication | Username → email RPC → JWT |
| 14. Database queries from Flutter | PostgREST, RPC, repositories |
| 15. Row Level Security | Policies, helpers, role matrix |
| Tier 5 — Advanced platform | Tutorials 16–20 |
| 16. File upload & Storage | Buckets, paths, signed URLs |
| 17. Realtime | Chat and notification channels |
| 18. Localization | ARB EN/RU/UZ |
| 19. Theming & dark mode | Four styles × light/dark |
| 20. Notifications (real system) | Table + Realtime; FCM is future work |
| Tier 6 — Complete features | Tutorials 21–25 |
| 21. Authentication feature | Splash → login → language → shell |
| 22. Assignments feature | Packs, tasks, submit, grade |
| 23. Chat feature | Rooms, media, reactions, unread |
| 24. Attendance feature | Sessions, statuses, reports |
| 25. Announcements feature | Group posts, attachments, notify |
| Tier 7 — Going deep | Tutorials 26–30 |
| 26. Custom widgets | Shell, cards, bubbles, empty states |
| 27. Testing | Unit, widget, integration habits |
| 28. Performance | Cache, paging, image, query shape |
| 29. Error handling | AsyncValue, offline, user copy |

| Section | What you gain |
|---|---|
| 30. Deployment | APK, web, iOS, store hygiene |
| Source atlas | Every Dart file with purpose + full listing |
| Annotated source | Every interesting line explained |
| SQL atlas + annotated SQL | Functions and statement-by-statement |
| Screen / provider / component manuals | QA for every UI module |
| 30-day journal + oral exam | Calendar and 50 spoken answers |
| Every-line Dart commentary | Non-trivial lines with a one-sentence why |
| ARB key catalog | EN / RU / UZ side by side |
| RLS in English | Every policy said as a sentence |
| Appendix A — Complete backend SQL | Run top to bottom on a new project |
| Appendix B — Dependencies | Every pubspec package explained |
| Appendix C — Video index | All links by topic |
| Appendix D — Troubleshooting | Errors you will actually hit |
| Appendix E — Architecture diagrams | Data, widgets, providers, schema |
| Appendix F — Code style guide | Names, files, comments |
| Appendix G — Column catalog | Every table, every column |
| Appendix H — ARB catalogs | EN / RU / UZ |
| Appendix I — First admin bootstrap | Create @admin safely |
| Appendix J — Config files | Makefile, l10n, manifests |
| Appendix K — Glossary & quizzes | Terms + extra practice |
| Appendix L — Foundation essays | HTTP, JSON, JWT, Git, Postgres types |

# Tier 1 — Fundamentals

No Flutter coding yet. You learn the product, the database vocabulary, the Supabase dashboard, and how secrets stay out of Git. If you cannot explain who creates accounts and why students must not see each other’s marks, do not start Tutorial 5.

# Tutorial 1 — Understanding the MU Study project

| Field | Value |
|---|---|
| Tutorial | 1 — Understanding MU Study |
| Difficulty | ★ easiest |
| Time | 20–30 minutes |
| Prerequisites | None |
| Verify yourself | Every TASK has an independent CHECKPOINT. Do not skip it. |

### Video resources

Watch at least one video before the task. Videos teach the general technology; this book teaches how MU Study uses that technology. Pause the video and map each concept onto a file in this repository.

| Resource | URL |
|---|---|
| What is Flutter? — Flutter Official | https://www.youtube.com/watch?v=fDkQWZDu6UU |
| What is Supabase? — Supabase Channel | https://www.youtube.com/watch?v=WiwfiP2jtjY |

## What MU Study is

MU Study is a school management and study platform built for Math and English teachers and their students. It is not a public social network. There is no self-registration button. An administrator creates every username and password. Parents are not a first-class role in the current schema — a parent who needs access would be given a student or admin account by policy, not a parent table.

The client is a Flutter app that runs on Android, iOS, and Web. Phones use a bottom navigation bar. Wider layouts use a navigation rail. A permanent desktop-only sidebar is intentionally omitted (see README). The look is Material 3 with a chocolate/sand default plus three additional visual styles.

## Who uses it

| Role | Database | What they do in the app |
|---|---|---|
| Student | profiles + students + group_students | Homework, marks, attendance view, chat, focus timer, notifications |
| Teacher | profiles + teachers (sphere) | Own groups, assignments, gradebook, take attendance, announcements, chat |
| Admin | profiles.role = admin | Users, groups, academic years, school announcements, credential slips, mass generator |

A teacher's sphere is required: **math** or **english** (Postgres enum sphere_type). Admins do not auto-create groups when they add a teacher. They type exact group titles later.

## What you can do (feature map)

- Sign in with username + password (behind the scenes: synthetic email + Supabase Auth).
- Pick English, Russian, or Uzbek once; the choice is stored on the profile.
- Students: dashboard announcements, assignments (static vs homework pack), task submit (text/file/voice), marks, attendance calendar, group chat, focus mode, inbox.
- Teachers: create assignments and tasks, review submissions, gradebook, attendance grid, analytics charts, group announcements, chat.

• Admins: create/disable users, create groups and memberships, academic years/terms, print login slips, optional mass data generator.

## Technology stack at a glance

| Layer | Choice in this repo | Why |
|---|---|---|
| UI | Flutter 3 / Dart ^3.11.5 | One codebase for Android, iOS, Web |
| State | flutter_riverpod | Typed providers, no BuildContext lookup |
| Routes | go_router | Path URLs + redirect on auth/language |
| Backend | Supabase | Auth + Postgres + Storage + Realtime hosted together |
| Database | PostgreSQL 17 | RLS, enums, triggers, views |
| Files | Supabase Storage | Avatars public; work and chat private |
| Live updates | Supabase Realtime | Chat + notifications without polling |
| i18n | gen-l10n ARB | en / ru / uz |

## Architecture overview

**Mental model**

```
Phone / browser
  Flutter widgets (screens + components)
    Riverpod providers (auth, lists, streams)
      supabase_flutter client
        HTTPS → Supabase project
          Auth  |  PostgREST (tables/RPC)  |  Storage  |  Realtime
            PostgreSQL with RLS + triggers
```

Security is not “hide the admin button in Flutter.” A student who crafts an HTTP request still hits RLS. If a student can SELECT another student’s marks in the SQL Editor while logged in as that student JWT, the product is broken — even if the UI never showed a button.

## Screens you will tour

On a working instance you will see Splash → Login → Language (first time) → a role home. Student home shows announcements. Teacher home shows group shortcuts. Admin home shows platform counts. Chat is a shared pair of screens under /student/chat, /teacher/chat, /admin/chat.

**TASK — 1.1 Screenshot tour**
1) Open a running MU Study build (this repo: make run, or the web target).
2) Log in as each role you have (student, teacher, admin).
3) Capture: login, language (if shown), dashboard, assignments, marks, chat list, profile.
4) On each screenshot, write which table the visible titles/dates come from (announcements, assignments, marks, chat_room_summaries, profiles).
5) Store the images in a private notes folder — not in git if they show real names.

**CHECKPOINT — Independent verification**
Hand your screenshots to a classmate (or your future self tomorrow). They should be able to say: three roles, no public Register button, chat is per group, marks exist as a separate screen from assignments. If they think anyone can sign up, you labeled the product wrong — re-read this tutorial.

### Common mistakes

**WARNING — Treating MU Study like Instagram**
There is no public feed of all students. Data is scoped by group membership and RLS.

**WARNING — Assuming email login**
The field says Username. Email is an implementation detail of Auth.

**WARNING — Assuming Arabic or FCM**
This product ships EN/RU/UZ and in-app notifications.

## What you just learned

- MU Study is a closed school platform with admin-created accounts.
- Three roles sit on one Flutter client with different shells.
- Supabase is the backend; Flutter never talks to Postgres with a raw password.

## Self-check quiz (cover the answers)

**Q1.** Who creates student accounts?

**Answer 1**
An admin, via Admin → Users / admin_create_user. Not the student.

**Q2.** Name the three locales.

**Answer 2**
en, ru, uz.

**Q3.** What is a teacher sphere?

**Answer 3**
math or english — required when creating a teacher.

# Tutorial 2 — Database concepts for MU Study

| Field | Value |
|---|---|
| Tutorial | 2 — Database concepts |
| Difficulty | ★ easiest |
| Time | 30–40 minutes |
| Prerequisites | Tutorial 1 |
| Verify yourself | Every TASK has an independent CHECKPOINT. Do not skip it. |

### Video resources

Watch at least one video before the task. Videos teach the general technology; this book teaches how MU Study uses that technology. Pause the video and map each concept onto a file in this repository.

| Resource | URL |
|---|---|
| Database Basics — Crash Course | https://www.youtube.com/watch?v=oCgc3fumTW0 |
| SQL for Beginners — freeCodeCamp | https://www.youtube.com/watch?v=HXV3zeQKqGY |
| PostgreSQL Tutorial — Amigoscode | https://www.youtube.com/watch?v=qw--VYLpxG4 |

## What a database is

A database is organized storage with rules. A spreadsheet can hold names, but it will not stop two students from sharing the same impossible grade or stop a deleted group from leaving orphan attendance rows. PostgreSQL enforces primary keys, foreign keys, checks, and — in this project — row-level security.

## Tables, rows, columns — using students and groups

A **table** is a named collection of rows with the same columns. A **row** is one student, one group, one mark. A **column** is one field (id, title, sphere). MU Study's students table does not store the display name. The name lives on profiles. students.profile_id points at profiles.id. That is a foreign key.

**Conceptual (IDs are UUIDs in the real app)**

```
profiles
id (PK=auth.users.id) | username | full_name | role
aaa...                | ali      | Ali Karimov| student
bbb...                | sara     | Sara Lee   | student
ccc...                | ms_ng    | N. Green   | teacher

students                teachers
id (PK) | profile_id(FK)   id (PK) | profile_id(FK) | sphere
s1      | aaa...           t1      | ccc...         | math

groups
id (PK) | teacher_id (FK→teachers.id) | title
g1      | t1                          | Algebra A

group_students
id | group_id (FK) | student_id (FK)
1  | g1            | s1
```

Notice students.id is not the same as profiles.id. Chat sender_id is a profile id (auth.uid()). Attendance.student_id is students.id. Mixing those UUIDs is the #1 join bug in this codebase. Always ask: "is this a profile id or a student row id?"

## Primary keys and foreign keys

A primary key uniquely identifies a row. MU Study uses UUID keys generated by gen_random_uuid(), except profiles.id which is the Auth user id (no default — you insert the same UUID you put into auth.users). A foreign key says “this column must point at a real row.” ON DELETE CASCADE means deleting a group deletes its assignments, memberships, and chat room. That is intentional: a group is a container.

## Data types you will see

| Type | Example column | Meaning |
|---|---|---|
| uuid | assignments.id | 128-bit identifier |
| text | groups.title | Unlimited string |
| timestamptz | assignments.due_date | Instant with time zone |
| date | attendance.date | Calendar day |
| boolean | profiles.is_disabled | true/false |
| numeric | marks.percentage | Decimal 0–100 |
| jsonb | announcements.image_urls | JSON array of URLs |
| user_role | profiles.role | enum student\|teacher\|admin |
| sphere_type | teachers.sphere | enum math\|english |

## Schema overview — why ~20 tables

| Table | Purpose |
|---|---|
| profiles | Login identity, role, prefs, avatar |
| teachers / students | Role-specific rows (sphere; student memberships) |
| groups / group_students | Class sections and roster |
| assignments / tasks / submissions / assignment_templates | Work and answers |
| lesson_sessions / attendance | Roll call per day |
| marks | Gradebook (weighted percentage) |
| announcements / notifications | Posts and per-user inbox |
| academic_years / academic_terms | School calendar (semesters 1–4) |
| chat_rooms / chat_messages / message_reads / message_reactions | Group chat |

Views are stored queries, not tables: chat_room_summaries, student_mark_averages, student_group_mark_averages. The Flutter chat list reads the summaries view, then merges unread counts from the chat_unread_counts RPC.

**TASK — 2.1 Data modeling**
On paper, draw: auth.users 1—1 profiles 1—0..1 teachers|students. teachers 1—* groups *—* students via group_students. groups 1—1 chat_rooms. groups 1—* assignments 1—* tasks 1—* submissions.
Label every FK column name exactly (profile_id, teacher_id, student_id, group_id).
Circle the two different IDs for a student (profiles.id vs students.id).

**CHECKPOINT — Independent verification**
Without this book, list eight table names and one FK each. If you wrote students.group_id, you invented a column — MU Study uses group_students instead. Correct your diagram.

## Common mistakes

**WARNING — Putting group_id on students**
A student can be in many groups. Use group_students.

**WARNING — Using integer IDs in examples as if they were real**
Production IDs are UUIDs.

**WARNING — Forgetting CASCADE**
Deleting a teacher deletes their groups if FK is CASCADE — know the blast radius.

## What you just learned

- Tables/rows/columns, PK/FK, enums, views.
- Student identity is two UUIDs; do not mix them.
- The 20-table map matches the live schema, not a blog example.

## Self-check quiz (cover the answers)

**Q1.** What table links a student to a group?

**Answer 1**
group_students.

**Q2.** Where is the teacher's subject stored?

**Answer 2**
teachers.sphere (sphere_type).

**Q3.** Is focus mode a table?

**Answer 3**
No. SharedPreferences only.

# Tutorial 3 — Supabase project setup

| Field | Value |
|---|---|
| Tutorial | 3 — Supabase setup |
| Difficulty | ★★ very easy |
| Time | 15–25 minutes |
| Prerequisites | Tutorial 1; a browser; an email |
| Verify yourself | Every TASK has an independent CHECKPOINT. Do not skip it. |

### Video resources

Watch at least one video before the task. Videos teach the general technology; this book teaches how MU Study uses that technology. Pause the video and map each concept onto a file in this repository.

| Resource | URL |
|---|---|
| Supabase Setup & Tutorial — Official | https://www.youtube.com/watch?v=I6nnp6kS3F8 |
| Supabase Full Course — Codementor | https://www.youtube.com/watch?v=rypsG5tqz8Q |

## Create the project

1. Go to supabase.com and sign in.
2. New project. Name it something like mu_study_dev. Pick the closest region. Set a database password and store it in a private notes file — not in the Flutter repo.
3. Wait until the project is healthy (a few minutes).
4. Settings → Data API (or API): copy Project URL https://YOURREF.supabase.co.
5. Copy the anon / publishable key (starts with eyJ or sb_publishable_). Never copy service_role into the app.
6. Open Table Editor (empty until you run SQL). Open SQL Editor for Tutorial 12+.

> **WARNING — Keys**
> anon/publishable = client. service_role = god mode. If service_role leaks, rotate it immediately. The Flutter Env class even rejects keys that start with sb_secret_.

## What you will run later

This tutorial does not apply the full schema yet (that is safer after you understand SQL). When you are ready, paste docs/tutorial/COMPLETE_BACKEND.sql in the SQL Editor top to bottom, then first_admin_bootstrap.sql with YOUR_STRONG_PASSWORD.

**SQL Editor smoke test (now)**

```
SELECT current_timestamp AS now, current_database() AS db;
```

> **TASK — 3.1 Supabase exploration**
> Create the project. Screenshot: Settings page showing Project URL (blur the key if you share the image). Run SELECT current_timestamp; in SQL Editor and screenshot the result. Write down region and project ref in private notes.

**CHECKPOINT — Independent verification**
A friend should be able to open your (blurred) URL screenshot and see a supabase.co host. Your SQL screenshot must show a timestamp, not an error. If Table Editor already shows 20 tables, you ran the schema early — that is fine, but still keep the smoke query.

## Common mistakes

**WARNING — Putting service_role in .env used by Flutter**
Env.sanitize should empty it; if you bypass that, any user of the APK is a DBA.

**WARNING — Using the hosted demo project as production**
nmmdvdprczukaskxxdrs in Env is a development default. Create your own for learning.

## What you just learned

- Project URL + anon key are the only client secrets.
- SQL Editor is your source of truth for schema work.

## Self-check quiz (cover the answers)

**Q1.** Which key goes in Flutter?

**Answer 1**
anon / publishable, never service_role.

**Q2.** What does SELECT current_timestamp prove?

**Answer 2**
The database is reachable and you can run SQL.

# Tutorial 4 — Environment variables and configuration

| Field | Value |
|---|---|
| Tutorial | 4 — Environment variables |
| Difficulty | ★★ very easy |
| Time | 20 minutes |
| Prerequisites | Tutorial 3 |
| Verify yourself | Every TASK has an independent CHECKPOINT. Do not skip it. |

### Video resources

Watch at least one video before the task. Videos teach the general technology; this book teaches how MU Study uses that technology. Pause the video and map each concept onto a file in this repository.

| Resource | URL |
|---|---|
| Environment Variables — Fireship | https://www.youtube.com/watch?v=HXZpY4sUmqQ |
| flutter_dotenv package walkthrough | https://pub.dev/packages/flutter_dotenv |

## Why .env exists

Source code is copied, forked, and pushed. Secrets must not ride along. MU Study loads SUPABASE_URL and SUPABASE_ANON_KEY (or SUPABASE_PUBLISHABLE_KEY) from a .env file via flutter_dotenv, or from --dart-define-from-file=.env at run time.

**.env (local only — already in .gitignore)**

```
SUPABASE_URL=https://YOUR_PROJECT_REF.supabase.co
SUPABASE_ANON_KEY=eyJ_your_anon_or_publishable_key
```

## How Flutter loads it in this repo

lib/core/constants/env.dart is the whole story. Env.load() first checks String.fromEnvironment (dart-define). If SUPABASE_ANON_KEY is empty, it tries dotenv.load(fileName: '.env'). Then _sanitizeKey() rejects placeholders, your_ prefixes, paste_your, sb_secret_, and keys that do not start with eyJ or sb_publishable_. If the key is rejected, Env.isConfigured is false and main.dart shows SetupRequiredScreen instead of initializing Supabase.

pubspec.yaml lists .env under flutter assets so dotenv can load it on devices. That means a release APK can contain the anon key — which is expected for a public client key — but it must never contain service_role. Prefer CI dart-defines for production builds so you are not editing a committed asset.

**Run (README)**

```
flutter pub get
flutter run --dart-define-from-file=.env
```

> **TASK — 4.1 Create .env**
> 1) In the project root, create .env with YOUR URL and anon key (placeholders shown above).
> 2) Confirm .gitignore contains .env (it does in this repo).
> 3) Run flutter run --dart-define-from-file=.env (or make run if your Makefile injects env).
> 4) You must not stay on SetupRequiredScreen if the key is valid.

**CHECKPOINT — Independent verification**
Run: git check-ignore -v .env — it must report .gitignore. Run the app with an empty key: SetupRequiredScreen appears. Restore the key: splash/login appears. That A/B test proves Env, not luck.

## Common mistakes

**WARNING — Committing .env**
Rotate the anon key if it hit a remote.

**WARNING — Whitespace or quotes around the key**
trim() helps, but quotes can still break JWT parse.

**WARNING — Using the service role because “login failed”**
Login failures are almost never fixed by god keys. Fix RPC grants and passwords.

## What you just learned

- Env.isConfigured gates the entire app.
- .env is gitignored; dart-define is the clean run path.

## Self-check quiz (cover the answers)

**Q1.** What screen appears when the key is sanitized to empty?

**Answer 1**
SetupRequiredScreen.

**Q2.** Name two accepted key prefixes.

**Answer 2**
eyJ and sb_publishable_.

# Tier 2 — Flutter basics

You create the project shape, learn Dart, build widgets, and wire go_router the way MU Study does: splash, login, language gate, then a role shell.

# Tutorial 5 — Flutter project structure

| Field | Value |
|---|---|
| Tutorial | 5 — Project structure |
| Difficulty | ★★ very easy |
| Time | 25 minutes |
| Prerequisites | Flutter SDK; Tutorial 1 |
| Verify yourself | Every TASK has an independent CHECKPOINT. Do not skip it. |

### Video resources

Watch at least one video before the task. Videos teach the general technology; this book teaches how MU Study uses that technology. Pause the video and map each concept onto a file in this repository.

| Resource | URL |
|---|---|
| Flutter Project Structure — The Net Ninja | https://www.youtube.com/watch?v=u3R2cCP_ynI |
| Flutter for Beginners — Udacity | https://www.youtube.com/watch?v=7nAMS3cAr3c |

## What flutter create gives you

flutter create --org com.example --project-name mu_study . produces android/, ios/, web/, lib/main.dart, and pubspec.yaml. MU Study's applicationId is com.example.mu_study and the iOS bundle is com.example.muStudy. You will not write Kotlin/Swift for features; you will add microphone/photo permissions for chat voice and images.

**Actual lib/ layout**

```
lib/
  main.dart
  core/          constants, theme, router, services, utils
  models/        enums + domain classes
  providers/     Riverpod (auth, homework, chat, …)
  screens/       auth, student, teacher, admin, chat, profile
  components/    shell, cards, attachments, charts
  l10n/          ARB + generated localizations
  supabase/      supabase_client.dart one-liner
```

pubspec.yaml is the manifest: SDK constraint, dependencies, assets (images, lottie, .env), and generate: true for l10n. After editing it, flutter pub get. After editing ARB files, flutter gen-l10n (or the next flutter run).

**TASK — 5.1 Walk the tree**
From the repo root: list lib/ directories. Open pubspec.yaml and count dependencies. Open android/app/src/main/AndroidManifest.xml and find INTERNET and RECORD_AUDIO. Open ios/Runner/Info.plist and find microphone / photo usage strings. Run flutter pub get and confirm no errors.

**CHECKPOINT — Independent verification**
Write a 10-line tree of lib/ from memory. If you invented lib/services/ as a top-level folder, look again — services live under lib/core/services/ and screens call providers.

### Common mistakes

> **WARNING — Editing files under .dart_tool or build/**
> Those are generated. Your code is lib/.

> **WARNING — Forgetting generate: true**
> AppLocalizations will not exist.

## What you just learned

- lib/ is the product. pubspec is the bill of materials.

## Self-check quiz (cover the answers)

**Q1.** Where is go_router configured?

> **Answer 1**
> lib/core/router/app_router.dart

**Q2.** Where is the Supabase client accessor?

> **Answer 2**
> lib/supabase/supabase_client.dart

# Tutorial 6 — Dart basics

| Field | Value |
|---|---|
| Tutorial | 6 — Dart basics |
| Difficulty | ★★ very easy |
| Time | 45 minutes |
| Prerequisites | Tutorial 5 |
| Verify yourself | Every TASK has an independent CHECKPOINT. Do not skip it. |

### Video resources

Watch at least one video before the task. Videos teach the general technology; this book teaches how MU Study uses that technology. Pause the video and map each concept onto a file in this repository.

| Resource | URL |
|---|---|
| Dart for Beginners — Fireship | https://www.youtube.com/watch?v=Ej_Pcr4uC2Q |
| Dart Null Safety — Dart Official | https://www.youtube.com/watch?v=IqD_wjsDMKU |

## Types you will use daily

**dart**

```
final String username = 'ali';
const int pageSize = 20;
bool isDisabled = false;
String? avatarUrl; // null until uploaded
final roles = <String>['student', 'teacher', 'admin'];
final row = <String, dynamic>{'full_name': 'Ali', 'role': 'student'};
```

final is assign-once. const is compile-time. var exists but this codebase prefers explicit types on public APIs. dynamic appears in JSON maps from Supabase — you immediately cast into models.

## Functions and named parameters

**Like AuthRepository.changePassword**

```
Future<void> changePassword({
  required String username,
  required String currentPassword,
  required String newPassword,
}) async {
  // …
}
```

## Classes — Profile is the teaching example

lib/models/profile.dart is a plain class: constructor, fields, fromJson, toJson. JSON keys are snake_case. There is no Freezed code generation in the models folder even though freezed is in pubspec (available, not used for Profile). Learn both styles; ship what the repo actually compiles.

**Null safety in login**

```
final email = await resolveAuthEmail(username);
if (email == null) {
  throw const AuthException('Incorrect username or password');
}
await supabase.auth.signInWithPassword(email: email, password: password);
```

**TASK — 6.1 Dart exercises (file: test or dartpad)**
1) Class User { name, email, role } with a role string.
2) Function studentsOnly(List) → only role == 'student'.
3) Function printUsers(Map) prints username → role.
4) Give email a String? if it can be missing; do not use ! unless you just checked null.

**CHECKPOINT — Independent verification**
Write a tiny test or main() that fails if studentsOnly keeps a teacher. Run it. If you only "looked at the code," you did not verify.

## Common mistakes

**WARNING — Using user.role! everywhere**
If role is non-nullable, do not add ?. If it is nullable, handle both cases.

**WARNING — Parsing JSON without fromJson**
You will typo fullName vs full_name.

## What you just learned

- final/const, named args, null-aware login path, model classes.

## Self-check quiz (cover the answers)

**Q1.** Why is email String? from the RPC?

**Answer 1**
Disabled or unknown usernames return null.

**Q2.** What does Profile.fromJson read for the name?

**Answer 2**
json['full_name'].

# Tutorial 7 — Flutter widgets and layouts

| Field | Value |
|---|---|
| Tutorial | 7 — Widgets & layouts |
| Difficulty | ★★★ easy |
| Time | 45 minutes |
| Prerequisites | Tutorial 6 |
| Verify yourself | Every TASK has an independent CHECKPOINT. Do not skip it. |

## Video resources

Watch at least one video before the task. Videos teach the general technology; this book teaches how MU Study uses that technology. Pause the video and map each concept onto a file in this repository.

| Resource | URL |
|---|---|
| Flutter Widgets — The Net Ninja | https://www.youtube.com/watch?v=u_rbIqnRDms |
| Flutter Layout Tutorial — Flutter Official | https://www.youtube.com/watch?v=_58-kTsPq9c |
| Material Design in Flutter — Google | https://www.youtube.com/watch?v=DL0Ix1lnK4k |

Everything on screen is a widget. LoginScreen is a ConsumerStatefulWidget: it owns TextEditingControllers and a loading flag. The visual tree is Scaffold → decorations → fields → PrimaryButton. Read lib/screens/auth/login_screen.dart after you can build a boring Column yourself.

**Minimum login-shaped UI (practice, not the production file)**

```
Scaffold(
  appBar: AppBar(title: const Text('MU Study')),
  body: Padding(
    padding: const EdgeInsets.all(24),
    child: Column(
      children: [
        TextField(decoration: InputDecoration(labelText: 'Username')),
        TextField(obscureText: true, decoration: InputDecoration(labelText: 'Password')),
        ElevatedButton(onPressed: () {}, child: Text('Sign in')),
      ],
    ),
  ),
);
```

Production login uses localized labels (context.l10n.loginUsername), AppLogo, paper décor for Nature Paper style, and maps errors to loginIncorrect / loginConfigError. There is no “Forgot password?” for students — admins reset passwords (admin_reset_password). Do not add a fake forgot-password that emails mustudy.internal addresses.

**TASK — 7.1 Build a practice login UI**
In a scratch file or a temporary route, build username + password + sign-in button with spacing. Then open the real LoginScreen and list five widgets it uses that yours does not (logo, l10n, PrimaryButton, error text, loading).

**CHECKPOINT — Independent verification**
flutter run shows your practice UI. A screenshot with empty AppBar title means you skipped MaterialApp or localization — wrap with MaterialApp for the exercise.

## Common mistakes

**WARNING — Unbounded ListView inside Column**
Use Expanded or ListView as the body.

**WARNING — Hard-coded English on production screens**
Use ARB keys; Tutorial 18.

## What you just learned

- Scaffold, fields, buttons, why production login is richer.

## Self-check quiz (cover the answers)

**Q1.** Who resets a forgotten password today?

**Answer 1**
An admin, not a public email flow.

# Tutorial 8 — Stateful vs Stateless widgets

| Field | Value |
|---|---|
| Tutorial | 8 — Stateful vs Stateless |
| Difficulty | ★★★ easy |
| Time | 30 minutes |
| Prerequisites | Tutorial 7 |
| Verify yourself | Every TASK has an independent CHECKPOINT. Do not skip it. |

## Video resources

Watch at least one video before the task. Videos teach the general technology; this book teaches how MU Study uses that technology. Pause the video and map each concept onto a file in this repository.

| Resource | URL |
|---|---|
| Stateful vs Stateless — Flutter Official | https://www.youtube.com/watch?v=wE7khGHVkYY |
| Flutter State Management — Fireship | https://www.youtube.com/watch?v=lTnXr8XO0Ys |

StatelessWidget is a function of its constructor arguments. Greeting(name: 'Ali') never changes unless the parent passes a new name. StatefulWidget owns a State object. LoginScreen's _loading and _error live there. setState schedules a rebuild.

MU Study uses State for controllers and ephemeral UI (forms, sheets). Shared data (profile, assignments, chat) lives in Riverpod so two screens stay in sync. If you put the assignment list in a State object on one screen, the dashboard will not see updates. That is why Tutorial 10 exists.

**Ephemeral vs app state**

```
// Ephemeral — State is correct
bool _obscure = true;

// App state — Riverpod is correct
final currentProfileProvider = FutureProvider<Profile?>(...);
```

> **TASK — 8.1 Mini todo widget**
> StatefulWidget with List todos, TextField, add button, ListView. Then write two sentences: why this todo list should NOT be how MU Study stores assignments (no RLS, no teacher, no persistence).

> **CHECKPOINT — Independent verification**
> Adding a todo updates the list without a full app restart. Hot reload may reset State — that is expected. If add does nothing, you forgot setState.

## Common mistakes

> **WARNING — Calling setState after dispose**
> Guard with if (!mounted) return; after awaits — LoginScreen does this.

## What you just learned

- State is for local UI. Riverpod is for shared/async data.

## Self-check quiz (cover the answers)

**Q1.** Is currentProfileProvider a State field?

> **Answer 1**
> No. It is a FutureProvider.

# Tutorial 9 — Navigation with GoRouter

| Field | Value |
|---|---|
| Tutorial | 9 — GoRouter |
| Difficulty | ★★★ easy |
| Time | 40 minutes |
| Prerequisites | Tutorial 8 |
| Verify yourself | Every TASK has an independent CHECKPOINT. Do not skip it. |

### Video resources

Watch at least one video before the task. Videos teach the general technology; this book teaches how MU Study uses that technology. Pause the video and map each concept onto a file in this repository.

| Resource | URL |
|---|---|
| GoRouter — Flutter Official | https://www.youtube.com/watch?v=Y9DLpnBckso |
| Navigation in Flutter — Fireship | https://www.youtube.com/watch?v=xYPCrZ5iHzQ |

lib/core/router/app_router.dart defines routerProvider. GoRouter starts at /splash. _RouterNotifier listens to authStateProvider and currentProfileProvider and calls notifyListeners so redirect re-runs. That is how login “just works” without a manual context.go in every success path (login still goes to /boot to settle).

## Redirect rules (actual)

1. If location is /splash, do not redirect (splash decides).
2. If no session → /login (unless already there).
3. If profile is still loading (first load) → /boot.
4. If profile is null → /login.
5. If profile.isDisabled → /account-disabled.
6. If preferred_language is empty → /language.
7. If on /login, /boot, or /language after all gates pass → role home (/student/dashboard, /teacher/dashboard, /admin/dashboard).
8. Otherwise null (allow the navigation).

Each role is a ShellRoute with destinations. Student includes Focus. Teacher includes gradebook and attendance. Admin includes users and groups. Chat is parameterized: ChatListScreen(basePath: '/teacher/chat') so one widget serves three shells.

**Path parameters (homework)**

```
/student/tasks/:taskId  → StudentTaskSubmitScreen
/teacher/assignments/:id → TeacherHomeworkPackScreen
/*/chat/:roomId         → ChatRoomScreen
```

> **TASK — 9.1 Trace one navigation**
> On paper, start at /splash with no session. Write every location until student home for a user who has never chosen a language. Then repeat for a disabled teacher. Open app_router.dart and confirm your trace.

**CHECKPOINT — Independent verification**
Log in as a new user (no preferred_language). You must hit LanguageSelectionScreen before any dashboard. Log in as a disabled profile (set is_disabled true in SQL). You must see account disabled copy, not a dashboard.

## Common mistakes

**WARNING — Redirecting /splash to /login immediately**
You skip the brand splash and may race auth restore.

**WARNING — Checking role only in the widget**
Deep links would still open teacher URLs. Redirect is the gate.

## What you just learned

- refreshListenable + redirect is the session backbone.

## Self-check quiz (cover the answers)

**Q1.** What path is the language gate?

**Answer 1**
/language

**Q2.** Why /boot exists?

**Answer 2**
Hold UI while the first profile Future loads without tearing down a shell.

# Tier 3 — State management

Riverpod is how MU Study holds session, lists, and streams. Models are how JSON from PostgREST becomes typed Dart. Master both before writing repositories.

# Tutorial 10 — Riverpod basics

| Field | Value |
|---|---|
| Tutorial | 10 — Riverpod |
| Difficulty | ★★★ easy |
| Time | 50 minutes |
| Prerequisites | Tutorial 9 |
| Verify yourself | Every TASK has an independent CHECKPOINT. Do not skip it. |

## Video resources

Watch at least one video before the task. Videos teach the general technology; this book teaches how MU Study uses that technology. Pause the video and map each concept onto a file in this repository.

| Resource | URL |
|---|---|
| Riverpod Tutorial — Fireship | https://www.youtube.com/watch?v=9EDFCZ0SqEA |
| Riverpod for State Management — Codepur | https://www.youtube.com/watch?v=GxXSiSkJUvY |
| Riverpod Documentation | https://riverpod.dev/ |
| Riverpod Complete Course — Tomic Riedel | https://www.youtube.com/watch?v=W_nqHaYVHjE |

main.dart wraps the app in ProviderScope. Widgets that need data extend ConsumerWidget or ConsumerStatefulWidget and call ref.watch / ref.read. watch rebuilds when the value changes. read is for clicks (login, increment).

## Provider types in this repo

| Type | Example | Use |
|---|---|---|
| Provider | authRepositoryProvider | Construct a service once |
| StreamProvider | authStateProvider | Supabase onAuthStateChange |
| FutureProvider | currentProfileProvider | One-shot fetch with loading/error |
| FutureProvider.family | announcementsProvider | Parameterized by groupId |
| StreamProvider (inbox) | notificationsProvider | Yield list, then re-yield on Realtime |
| Notifier / StateNotifier | chat messages, paging lists | Mutable collections + methods |
| State-like controllers | themeModeProvider, localeProvider | User preferences |

**Watching in a widget**

```
final profile = ref.watch(currentProfileProvider);
return profile.when(
  loading: () => const CircularProgressIndicator(),
  error: (e, _) => Text('Error: $e'),
  data: (p) => Text(p?.fullName ?? ''),
);
```

ref.invalidate(currentProfileProvider) after login forces a refetch. ref.refresh is similar and returns the new future. Use invalidate when you already navigated away and only need the next watch to reload.

**TASK — 10.1 / 10.2 Practice providers**
10.1 Build a counter with StateProvider and two buttons in a scratch app.
10.2 Build a FutureProvider that returns a fake Profile after a 1s delay. Show loading, error (throw once), and data. Add a retry that invalidates the provider.
Then open auth_provider.dart and match each real provider to a type in the table.

**CHECKPOINT — Independent verification**
Your counter updates without setState in the widget (the provider owns the int). Your FutureProvider demo shows all three AsyncValue branches. If you only used setState, redo 10.1.

## Common mistakes

**WARNING — watch inside onPressed**
Use read for events. watch belongs in build.

**WARNING — Forgetting ProviderScope**
Providers throw. main.dart already adds it.

## What you just learned

- watch vs read, AsyncValue.when, invalidate after login.

## Self-check quiz (cover the answers)

**Q1.** Which provider drives router refresh?

**Answer 1**
authStateProvider (+ currentProfileProvider).

# Tutorial 11 — Models and data classes

| Field | Value |
|---|---|
| Tutorial | 11 — Models |
| Difficulty | ★★★ easy |
| Time | 35 minutes |
| Prerequisites | Tutorial 6 |
| Verify yourself | Every TASK has an independent CHECKPOINT. Do not skip it. |

## Video resources

Watch at least one video before the task. Videos teach the general technology; this book teaches how MU Study uses that technology. Pause the video and map each concept onto a file in this repository.

| Resource | URL |
|---|---|
| Freezed Package — Codepur | https://www.youtube.com/watch?v=PkJCU-Qm3QM |
| Dart Models & Serialization — Fireship | https://www.youtube.com/watch?v=xXCG15nVP_8 |

Models are the contract with PostgREST. lib/models/enums.dart maps Dart enums to database strings. homework_pack is the important mismatch: Dart uses homeworkPack, Postgres uses homework_pack. assignmentTypeFromString / assignmentTypeToDb exist so you never send 'homeworkPack' to SQL.

Freezed is in pubspec for future use and for people following generic tutorials. The shipped models are hand-written. That is easier to read in a textbook and avoids a build_runner step for every field change. If you introduce Freezed, you must run dart run build_runner build and commit the generated files your team agrees on.

**Assignment.fromJson (real mapping)**

```
type: assignmentTypeFromString(json['type'] as String),
dueDate: json['due_date'] != null
    ? DateTime.parse(json['due_date'] as String)
    : null,
```

**TASK — 11.1 Create / inspect MU Study models**
Open profile.dart, assignment.dart, attendance.dart, mark.dart, chat.dart, notification.dart. For each class, write the table name and the JSON keys. Write a Dart snippet that parses a fake assignments row map and prints title + type. Assert type == AssignmentType.homeworkPack when type is homework_pack.

**CHECKPOINT — Independent verification**
Your snippet fails if you pass type: 'homeworkPack' (wrong) and succeeds for 'homework_pack'. That single test prevents a silent insert bug.

## Common mistakes

**WARNING — Sending enum.toString()**
Gives AssignmentType.homeworkPack — invalid for Postgres.

**WARNING — Assuming marks live on submissions only**
marks is its own table; submission_id is optional/unique.

## What you just learned

- snake_case JSON, enum DB helpers, hand-written models.

## Self-check quiz (cover the answers)

**Q1.** What helper writes assignment type to the database?

> **Answer 1**
> assignmentTypeToDb.

# Tier 4 — Database and backend

SQL, Auth, Flutter queries, and RLS. This tier is the difference between a demo and a school product.

# Tutorial 12 — SQL basics

| Field | Value |
|---|---|
| Tutorial | 12 — SQL basics |
| Difficulty | ★★★ easy |
| Time | 50 minutes |
| Prerequisites | Tutorials 2 and 3 |
| Verify yourself | Every TASK has an independent CHECKPOINT. Do not skip it. |

## Video resources

Watch at least one video before the task. Videos teach the general technology; this book teaches how MU Study uses that technology. Pause the video and map each concept onto a file in this repository.

| Resource | URL |
|---|---|
| SQL for Beginners — freeCodeCamp | https://www.youtube.com/watch?v=HXV3zeQKqGY |
| PostgreSQL Tutorial — Amigoscode | https://www.youtube.com/watch?v=qw--VYLpxG4 |
| SQL for Beginners — Programming with Mosh | https://www.youtube.com/watch?v=7S_tz1z_5bA |

Open SQL Editor on your project. After COMPLETE_BACKEND.sql is applied, these queries match real names. Until then, run them mentally or on the development project.

**Read / filter / join / aggregate**

```
-- All group titles for a teacher row
SELECT id, title FROM groups WHERE teacher_id = '<teacher-uuid>';

-- Students in a group with names
SELECT p.username, p.full_name
FROM group_students gs
JOIN students s ON s.id = gs.student_id
JOIN profiles p ON p.id = s.profile_id
WHERE gs.group_id = '<group-uuid>'
ORDER BY p.full_name;

-- Assignments due after now
SELECT title, due_date FROM assignments
WHERE due_date > now()
ORDER BY due_date;

-- Submissions per assignment (via tasks)
SELECT a.title, COUNT(sub.id) AS submitted
FROM assignments a
JOIN tasks t ON t.assignment_id = a.id
LEFT JOIN submissions sub ON sub.task_id = t.id AND sub.status <> 'pending'
GROUP BY a.id, a.title;

-- Weighted average (same idea as student_mark_averages view)
SELECT student_id,
  ROUND(SUM(percentage * weight) / NULLIF(SUM(weight), 0), 2) AS avg
FROM marks GROUP BY student_id;
```

> **WARNING — Writes**
> INSERT/UPDATE/DELETE in the SQL Editor run as the postgres role and bypass RLS. That is fine for seeding. It is not how the app works. Never “test security” as postgres.

**TASK — 12.1 Write SQL**
1) Assignments due after today (query above).
2) Marks for one student_id with group title (JOIN groups).
3) COUNT submissions per assignment.
Run them. Save the result screenshots privately.

**CHECKPOINT — Independent verification**
Each query has a WHERE or GROUP BY you can explain. If COUNT(*) from marks as postgres returns rows a student JWT cannot see, that is expected — you are DBA here.

## Common mistakes

**WARNING — SELECT * FROM students expecting names**
Join profiles.

**WARNING — Filtering assignments with due_date > CURRENT_DATE and forgetting time**
due_date is timestamptz.

## What you just learned

- SELECT/JOIN/GROUP BY on real MU Study names.

## Self-check quiz (cover the answers)

**Q1.** Which view already averages marks?

**Answer 1**
student_mark_averages and student_group_mark_averages.

# Tutorial 13 — Supabase authentication (the real login)

| Field | Value |
|---|---|
| Tutorial | 13 — Authentication |
| Difficulty | ★★★ easy |
| Time | 45 minutes |
| Prerequisites | Tutorials 3 and 12 |
| Verify yourself | Every TASK has an independent CHECKPOINT. Do not skip it. |

### Video resources

Watch at least one video before the task. Videos teach the general technology; this book teaches how MU Study uses that technology. Pause the video and map each concept onto a file in this repository.

| Resource | URL |
|---|---|
| Supabase Auth — Official | https://www.youtube.com/watch?v=6ow_jW7iS24 |
| Flutter Authentication — Fireship | https://www.youtube.com/watch?v=yH3NQFr3k0s |
| JWT explained — Fireship | https://www.youtube.com/watch?v=7Q17ubqLfaM |

## Flow

**Username login**

```
User types username + password
  → AuthRepository.signIn
  → rpc get_auth_email_by_username(p_username)
  → NULL if missing or is_disabled
  → signInWithPassword(email, password)
  → JWT stored by supabase_flutter
  → authStateProvider emits signedIn
  → currentProfileProvider loads profiles row
  → router redirect to language or role home
```

**get_auth_email_by_username (exact idea)**

```
SELECT auth_email FROM public.profiles
WHERE lower(username) = lower(trim(p_username))
  AND is_disabled = FALSE
LIMIT 1;
```

admin_create_user builds email as lower(trim(replace(username,'@',''))) || '@mustudy.internal'. Username @admin becomes admin@mustudy.internal. The first admin cannot call that RPC (nobody is admin yet). Use first_admin_bootstrap.sql once.

Do not create users in Authentication → Add user and forget profiles. The app will sign in then bounce to login because currentProfileProvider is null. Always create the pair: auth.users + identities + profiles + teachers/students.

**TASK — 13.1 / 13.2 First users**
13.1 After schema: run first_admin_bootstrap.sql with a password you invented. Verify: SELECT username, auth_email, role FROM profiles WHERE role = 'admin';
13.2 Run the Flutter app, log in as @admin. You should reach language then admin dashboard. Then create a teacher (math) and a student from Admin → Users. Log in as each.

**CHECKPOINT — Independent verification**
Wrong password → localized loginIncorrect, not a stack trace in release. Disabled user → RPC returns null → same incorrect message. SQL: SELECT auth.uid(); in a user session is not available in the dashboard the same way — instead confirm auth.users.email matches profiles.auth_email.

## Common mistakes

**WARNING — Inventing email in Dart**
Breaks if the scheme changes; leaks disabled usernames if you only skip is_disabled in the UI.

**WARNING — Unconfirmed email**
Bootstrap sets email_confirmed_at. Dashboard-created users may need confirm email disabled in Auth settings.

## What you just learned

- RPC → Auth → profile → router. First admin is a SQL bootstrap.

## Self-check quiz (cover the answers)

**Q1.** What email does username 'ms.green' become?

**Answer 1**
ms.green@mustudy.internal (dots stay; @ is stripped if present).

# Tutorial 14 — Supabase queries from Flutter

| Field | Value |
|---|---|
| Tutorial | 14 — Flutter queries |
| Difficulty | ★★★ easy |
| Time | 45 minutes |
| Prerequisites | Tutorials 12–13 |
| Verify yourself | Every TASK has an independent CHECKPOINT. Do not skip it. |

## Video resources

Watch at least one video before the task. Videos teach the general technology; this book teaches how MU Study uses that technology. Pause the video and map each concept onto a file in this repository.

| Resource | URL |
|---|---|
| Supabase Database Queries — Official | https://www.youtube.com/watch?v=zVlc_O_oJgA |
| Flutter + Supabase — Fireship | https://www.youtube.com/watch?v=eKvj2P3sJVU |

lib/supabase/supabase_client.dart exports supabase. Providers call supabase.from('table').select() with filters. RLS silently filters rows — an “empty list” is often a policy or membership problem, not an empty school.

**Patterns used in MU Study**

```
// Profile
await supabase.from('profiles').select().eq('id', uid).maybeSingle();

// Nested join (group members)
from('group_students').select('..., students(profiles(...))');

// RPC
await supabase.rpc('get_auth_email_by_username', params: {'p_username': name});
await supabase.rpc('ensure_lesson_session', params: {...});

// Insert assignment
await supabase.from('assignments').insert({...});
```

Ordering and limits: assignments and notifications use .order('created_at') and .limit(50) or paging helpers (PageResult). Do not download an entire marks table to the phone when a group filter exists.

**TASK — 14.1 Read the real repositories**
Open auth_provider.dart (profile fetch), group_providers.dart, assignment_providers.dart, marks_providers.dart. Write a table: method → .from/.rpc → filters. You do not need a separate students_repository.dart — this app folds access into providers. If you create one for practice, keep it out of the production path until it matches RLS.

**CHECKPOINT — Independent verification**
As a student JWT (use the app, not the SQL Editor as postgres), open marks. You should see only your rows. As that student’s classmate, you should not see the first student’s marks. That is Tutorial 15, but you can already observe it.

## Common mistakes

> **WARNING — Using .single() when 0 rows possible**
> Use maybeSingle() like ProfileRepository.

> **WARNING — .select() without filter on a huge table**
> Page and filter by group_id.

## What you just learned

- from/select/eq/rpc, empty list vs error, provider-as-repository.

## Self-check quiz (cover the answers)

**Q1.** Where is supabase defined?

> **Answer 1**
> Supabase.instance.client via supabase_client.dart.

# Tutorial 15 — Row Level Security and permissions

| Field | Value |
|---|---|
| Tutorial | 15 — RLS |
| Difficulty | ★★★★ medium |
| Time | 60 minutes |
| Prerequisites | Tutorials 12–14 |
| Verify yourself | Every TASK has an independent CHECKPOINT. Do not skip it. |

## Video resources

Watch at least one video before the task. Videos teach the general technology; this book teaches how MU Study uses that technology. Pause the video and map each concept onto a file in this repository.

| Resource | URL |
|---|---|
| Supabase RLS — Official | https://www.youtube.com/watch?v=Ow_Utn9OIMQ |
| PostgreSQL Row-Level Security — Amigoscode | https://www.youtube.com/watch?v=2IXAHGQJ0as |

ALTER TABLE … ENABLE ROW LEVEL SECURITY is not optional. Without policies, authenticated users see zero rows (default deny). Policies are named SQL predicates. MU Study factors repeated checks into functions: is_admin(), is_teacher_of_group(id), is_student_in_group(id), can_access_chat_room(id), current_profile_role().

**Mental policies (see export/rls_policies.sql for exact SQL)**

```
marks SELECT student: student_id = my students.id
marks SELECT teacher: is_teacher_of_group(group_id)
marks SELECT admin: is_admin()
marks INSERT/UPDATE: teacher of group or admin
notifications SELECT: user_id = auth.uid()
chat_messages *: can_access_chat_room(room_id)
```

UPDATE needs a SELECT policy on the same rows. If teachers can UPDATE marks but cannot SELECT them, updates affect 0 rows with no drama. When debugging “save does nothing,” check SELECT policies first.

**WARNING — Never authorize from user_metadata**
Supabase user_metadata is user-editable. Role lives in profiles.role. Helpers read that table (or related rows), not JWT user_metadata.

**TASK — 15.1 Prove RLS with two students**
Create student A and B in the same group. As teacher, insert two different marks. Log in as A — only A’s marks. Log in as B — only B’s. Log in as teacher — both. Optional: as A, try supabase.from('marks').select() in a debug print; count rows.

**CHECKPOINT — Independent verification**
A screenshot of two student accounts showing different mark lists, plus one SQL query as postgres showing both rows, is the proof. If both students see both rows, RLS is missing or you queried as service_role.

## Common mistakes

**WARNING — Testing RLS in SQL Editor as postgres**
You will always see everything. Use the app JWT.

**WARNING — Policy using submissions.group_id on marks**
marks has its own group_id. Copy-paste from blogs will not compile.

## What you just learned

- Default deny, helper functions, UPDATE needs SELECT.

## Self-check quiz (cover the answers)

**Q1.** Who can SELECT all profiles?

**Answer 1**
Admins; others see self, groupmates, chat senders — see policies.

# Tier 5 — Advanced platform features

Storage, Realtime, localization, theming, and the real notification system (not FCM).

# Tutorial 16 — File upload and Supabase Storage

| Field | Value |
|---|---|
| Tutorial | 16 — Storage |
| Difficulty | ★★★★ medium |
| Time | 50 minutes |
| Prerequisites | Tutorial 14 |
| Verify yourself | Every TASK has an independent CHECKPOINT. Do not skip it. |

## Video resources

Watch at least one video before the task. Videos teach the general technology; this book teaches how MU Study uses that technology. Pause the video and map each concept onto a file in this repository.

| Resource | URL |
|---|---|
| Supabase Storage — Official | https://www.youtube.com/watch?v=s7EwCRwxo5s |
| File Upload in Flutter — Fireship | https://www.youtube.com/watch?v=KLY_2vtuWsQ |

Buckets in this product: avatars (public), submissions, assignments, announcements, chat-images, chat-videos, chat-voices, chat-files (private). Public avatars use getPublicUrl. Private objects use createSignedUrl after upload.

**Path conventions**

```
avatars/{profileId}/avatar.jpg
submissions/{studentId}/{taskId}/{filename}
chat-images/{roomId}/{profileId}/{timestamp}_{filename}
```

Storage policies parse folder segments. Chat uploads require folder[1]=room the user can access and folder[2]=auth.uid(). A mismatch is 403, not a mysterious empty URL.

> **TASK — 16.1 Submit a file as a student**
> Create a homework_pack with one task. As student, open StudentTaskSubmitScreen, pick a small PDF or image, submit. In Storage, open submissions and find the object. In Table Editor, confirm submissions.file_url is a signed or stored URL. As another student, you must not download that object.

> **CHECKPOINT — Independent verification**
> Teacher can open the file from the review UI. Second student cannot. If both can, the bucket is public or the policy is USING(true).

## Common mistakes

> **WARNING — Uploading to avatars for homework**
> Wrong bucket; URLs become world-readable.

> **WARNING — Granting only INSERT on storage**
> Upsert/replace needs INSERT+SELECT+UPDATE.

## What you just learned

- Bucket privacy, path folders, signed URLs.

## Self-check quiz (cover the answers)

**Q1.** Which bucket is public?

> **Answer 1**
> avatars.

# Tutorial 17 — Realtime live updates

| Field | Value |
|---|---|
| Tutorial | 17 — Realtime |
| Difficulty | ★★★★ medium |
| Time | 50 minutes |
| Prerequisites | Tutorial 14 |
| Verify yourself | Every TASK has an independent CHECKPOINT. Do not skip it. |

## Video resources

Watch at least one video before the task. Videos teach the general technology; this book teaches how MU Study uses that technology. Pause the video and map each concept onto a file in this repository.

| Resource | URL |
|---|---|
| Supabase Real-time — Official | https://www.youtube.com/watch?v=lsKDFTL1YbQ |
| Real-time Chat Flutter — Fireship | https://www.youtube.com/watch?v=F7OX-pxjvPQ |

supabase_flutter v2 uses channel.onPostgresChanges, not the old .from().on() API you will still see in outdated blogs. notificationsProvider subscribes to public.notifications filtered by user_id. Chat providers subscribe to chat_messages, message_reads, and message_reactions. Tables must be in the supabase_realtime publication. message_reactions uses REPLICA IDENTITY FULL so updates/deletes emit payloads.

**notificationsProvider (shape)**

```
channel('notifications-${profile.id}')
  .onPostgresChanges(
    event: PostgresChangeEvent.all,
    schema: 'public',
    table: 'notifications',
    filter: PostgresChangeFilter(
      type: PostgresChangeFilterType.eq,
      column: 'user_id',
      value: profile.id,
    ),
    callback: (_) => changes.add(null),
  )
  .subscribe();
```

The stream yields an initial load, then re-fetches on each change. That is simpler than applying diffs and matches a 50-row inbox. Chat may append incrementally — read chat_providers.dart for the exact strategy.

> **TASK — 17.1 Two devices, one room**
> Open the same group chat on two accounts (teacher + student). Send a text. The other device must show it without pulling to refresh. Insert a notification row for user A in SQL; A's inbox badge must update.

> **CHECKPOINT — Independent verification**
> If only refresh-after-navigate works, Realtime is not subscribed or the table is not in the publication. Check Database → Publications → supabase_realtime.

## Common mistakes

> **WARNING — Copying RealtimeListenTypes from old tutorials**
> Use onPostgresChanges.

> **WARNING — Forgetting ref.onDispose(removeChannel)**
> Leaked channels; missed events after logout.

## What you just learned

- Channels, filters, publication, dispose.

## Self-check quiz (cover the answers)

**Q1.** Why REPLICA IDENTITY FULL on reactions?

> **Answer 1**
> Realtime needs old row keys on UPDATE/DELETE.

# Tutorial 18 — Localization (English, Russian, Uzbek)

| Field | Value |
|---|---|
| Tutorial | 18 — Localization |
| Difficulty | ★★★★ medium |
| Time | 45 minutes |
| Prerequisites | Tutorials 7 and 10 |
| Verify yourself | Every TASK has an independent CHECKPOINT. Do not skip it. |

## Video resources

Watch at least one video before the task. Videos teach the general technology; this book teaches how MU Study uses that technology. Pause the video and map each concept onto a file in this repository.

| Resource | URL |
|---|---|
| Flutter Localization — Official | https://www.youtube.com/watch?v=Zw3-fHMjVLw |
| i18n in Flutter — Fireship | https://www.youtube.com/watch?v=QDmKQkeSLfI |

l10n.yaml points at lib/l10n, template app_en.arb, class AppLocalizations, nullable-getter: false. That last flag means AppLocalizations.of(context) is non-null if delegates are installed — the code uses context.l10n via l10n_x.dart.

Languages are English, Russian, and Uzbek — not Arabic. First-run LanguageSelectionScreen writes profiles.preferred_language and SharedPreferences. The router blocks dashboards until that column is set. Profile settings can change it later via localeProvider.

**lib/l10n/app_en.arb (excerpt)**

```
 "loginSignIn": "Sign in",
 "navFocus": "Focus",
 "chatTitle": "Chat",
```

> **TASK — 18.1 Switch languages**
> Log in, pick Russian, confirm dashboard strings change. Repeat Uzbek. Restart the app — language persists. Add a harmless ARB key to all three files, run flutter gen-l10n, display it on the profile screen, then remove it if you do not want to keep it.

> **CHECKPOINT — Independent verification**
> SQL: preferred_language is ru or uz. flutter gen-l10n exits 0. A missing key in app_uz.arb fails generation — that failure is the test that you must edit all three.

## Common mistakes

> **WARNING — Hard-coding Arabic from a generic prompt**
> Wrong product.

> **WARNING — Only editing app_en.arb**
> Other locales fall back or fail CI.

## What you just learned

- ARB trio, language gate, context.l10n.

## Self-check quiz (cover the answers)

**Q1.** Which file is the template?

> **Answer 1**
> app_en.arb

# Tutorial 19 — Theming and dark mode

| Field | Value |
|---|---|
| Tutorial | 19 — Theming |
| Difficulty | ★★★★ medium |
| Time | 40 minutes |
| Prerequisites | Tutorials 7 and 10 |
| Verify yourself | Every TASK has an independent CHECKPOINT. Do not skip it. |

## Video resources

Watch at least one video before the task. Videos teach the general technology; this book teaches how MU Study uses that technology. Pause the video and map each concept onto a file in this repository.

| Resource | URL |
|---|---|
| Flutter Theming — Official | https://www.youtube.com/watch?v=oP3asNgo_Tw |
| Dark Mode in Flutter — Fireship | https://www.youtube.com/watch?v=h3bkKqFtaO4 |

AppStyle has four values: modern, naturePaper, softNeumorphism, monochromeWorkspace. themeMode is light, dark, or system. Both persist locally and on profiles.preferred_style / preferred_theme. main.dart overrides the controllers so a profile load applies the saved look. themeAnimationDuration is zero.

Nature Paper and Soft Neumorphism add backdrop widgets in MaterialApp.builder alongside ResponsiveBreakpoints. Tokens live in app_style_tokens.dart and per-style color files. Read AppTheme.light(style) / dark(style).

**TASK — 19.1 Toggle every combination**
On AppProfileScreen, walk 4 styles × 2 brightness modes (ignore system or set it). Confirm Nature Paper shows paper décor and Soft Neumorphism shows its backdrop. Restart — prefs survive. Change on device A, confirm profiles row updated, then login on device B (optional) to see server-followed style.

**CHECKPOINT — Independent verification**
preferred_style in SQL equals the enum name (naturePaper camelCase). If you stored nature_paper, tryParse fails and the UI falls back.

## Common mistakes

**WARNING — Animating theme between incompatible palettes**
The repo disables animation on purpose.

## What you just learned

- Four styles, themeMode, profile persistence.

## Self-check quiz (cover the answers)

**Q1.** Where are backdrops wrapped?

**Answer 1**
MuStudyApp builder → NaturePaperBackdrop → SoftNeumorphismBackdrop.

# Tutorial 20 — Notifications (what MU Study actually ships)

| Field | Value |
|---|---|
| Tutorial | 20 — Notifications |
| Difficulty | ★★★★★ hard conceptually |
| Time | 60 minutes |
| Prerequisites | Tutorials 13–14, 17 |
| Verify yourself | Every TASK has an independent CHECKPOINT. Do not skip it. |

### Video resources

Watch at least one video before the task. Videos teach the general technology; this book teaches how MU Study uses that technology. Pause the video and map each concept onto a file in this repository.

| Resource | URL |
|---|---|
| Supabase Real-time — Official | https://www.youtube.com/watch?v=lsKDFTL1YbQ |
| Firebase Cloud Messaging — Flutter | https://www.youtube.com/watch?v=aIRVqk9oE94 |
| Push Notifications in Flutter — Fireship | https://www.youtube.com/watch?v=7AtVo2H3g1s |

> **WARNING — Firebase Cloud Messaging is not in this repository**
> pubspec.yaml has no firebase_messaging. There is no FCM token column. Tutorial prompts that ask you to “send a test push from the Supabase dashboard” describe a different product. This tutorial teaches the real inbox, then sketches how FCM could be added later without pretending it already works.

## The real pipeline

**In-app notifications**

```
Teacher creates assignment
  → trg_assignment_notify / notify_user()
  → INSERT notifications (user_id, title, body, kind, action_path, ref_id)
  → Realtime event
  → notificationsProvider reloads
  → unreadNotificationsCountProvider updates shell badge
  → Student taps row → optional action_path via go_router
```

Similar triggers exist for announcements, submissions, marks, and chat messages (fn_trg_*.sql, fn_notify_user.sql, fn_notify_chat_message.sql). kind distinguishes system vs chat vs homework so the UI can icon and filter.

## If you add FCM later (design only)

You would store a device token per profile, send from an Edge Function on notification INSERT, and handle onMessageOpenedApp to context.go(action_path). That is a new project with APNs/FCM keys. Do not block reconstruction of MU Study on store push certificates.

> **TASK — 20.1 Prove in-app notifications**
> As teacher, create an assignment for a group that has a student. As student, watch the inbox and badge update without refresh. Mark as read; unread count drops. Read fn_trg_assignment_notify.sql and write the INSERT column list in your notes.

**CHECKPOINT — Independent verification**
Table Editor shows a notifications row with the student profile id. The student's phone showed it live. No Firebase console was involved. That is a pass.

## Common mistakes

**WARNING — Installing firebase_messaging "because the prompt said so"**
Out of scope unless you explicitly start a push project.

## What you just learned

- Inbox table + triggers + Realtime. FCM is optional future work.

## Self-check quiz (cover the answers)

**Q1.** Who inserts homework notifications?

**Answer 1**
A trigger after assignment insert, via notify helpers.

# Tier 6 — Complete features

You assemble end-to-end product flows. Each tutorial names the real screens, providers, tables, and RPCs.

# Tutorial 21 — Authentication feature (complete)

| Field | Value |
|---|---|
| Tutorial | 21 — Complete auth |
| Difficulty | ★★★★ medium |
| Time | 90 minutes |
| Prerequisites | Tutorials 10–15 |
| Verify yourself | Every TASK has an independent CHECKPOINT. Do not skip it. |

## Video resources

Watch at least one video before the task. Videos teach the general technology; this book teaches how MU Study uses that technology. Pause the video and map each concept onto a file in this repository.

| Resource | URL |
|---|---|
| Supabase Auth — Official | https://www.youtube.com/watch?v=6ow_jW7iS24 |
| Flutter Authentication — Fireship | https://www.youtube.com/watch?v=yH3NQFr3k0s |

Assemble SplashScreen, SetupRequiredScreen, LoginScreen, LanguageSelectionScreen, disabled account, AuthRepository, ProfileRepository, router redirect, cache fallback. Session persistence is supabase_flutter's job (local storage). Profile JSON is also cached in CacheService for offline display.

**Files to implement in order**

```
lib/core/constants/env.dart
lib/supabase/supabase_client.dart
lib/models/enums.dart
lib/models/profile.dart
lib/providers/auth/auth_provider.dart
lib/core/router/app_router.dart
lib/screens/auth/*.dart
lib/main.dart
```

> **TASK — 21.1 Full loop**
> Cold start → splash → login → language → admin home → logout → login as student → student home. Kill the process, relaunch: session restores, language not asked again. Change password as a user who has current password (profile settings). Disable a user; they cannot resolve email.

> **CHECKPOINT — Independent verification**
> Three accounts, three homes. SharedPreferences still has supabase session after relaunch (or you would see login). SQL is_disabled true blocks RPC.

## Common mistakes

> **WARNING — Skipping /language**
> Users with null preferred_language must not see role chrome.

## What you just learned

- The production auth loop, not a toy email form.

## Self-check quiz (cover the answers)

**Q1.** What does signOut clear besides Auth?

> **Answer 1**
> App caches via clearAllAppCaches.

# Tutorial 22 — Assignments feature (complete)

| Field | Value |
|---|---|
| Tutorial | 22 — Assignments |
| Difficulty | ★★★★★ hard |
| Time | 120 minutes |
| Prerequisites | Tutorials 10–16 |
| Verify yourself | Every TASK has an independent CHECKPOINT. Do not skip it. |

Teacher: TeacherAssignmentsScreen creates static or homework_pack rows for the active group. Packs open TeacherHomeworkPackScreen to add TaskItems (sort_order). Student: StudentAssignmentsScreen lists work. Packs open tasks; StudentTaskSubmitScreen upserts submissions (text, file_url, voice_url). TeacherSubmissionsScreen reviews. Marks may sync via fn_sync_submission_mark. trg_assignment_notify fans out inbox rows.

| Actor | Screen | Table/RPC |
|---|---|---|
| Teacher | TeacherAssignmentsScreen | assignments insert |
| Teacher | TeacherHomeworkPackScreen | tasks |
| Student | StudentTaskSubmitScreen | submissions + storage |
| Teacher | TeacherSubmissionsScreen | submissions update |
| Either | marks screens | marks / views |

**TASK — 22.1 End-to-end pack**
Teacher creates homework_pack “Fractions” with two tasks (one with a link). Student submits text on task 1 and a file on task 2. Teacher scores task 1. Student marks screen updates. Notification exists for the assignment create.

**CHECKPOINT — Independent verification**
UNIQUE (task_id, student_id) prevents a second submission row — upsert or error. SQL shows two tasks, two submissions, one mark. Classmate cannot open the file.

## Common mistakes

**WARNING — Treating static assignments as submit-able**
Product: static is display-only.

## What you just learned

- Pack vs static, task order, submission uniqueness, notify trigger.

## Self-check quiz (cover the answers)

**Q1.** Which enum value is stored for a pack?

**Answer 1**
homework_pack

# Tutorial 23 — Chat feature (complete)

| Field | Value |
|---|---|
| Tutorial | 23 — Chat |
| Difficulty | ★★★★★ hard |
| Time | 120 minutes |
| Prerequisites | Tutorials 10–17 |
| Verify yourself | Every TASK has an independent CHECKPOINT. Do not skip it. |

Chat is group-scoped, not a free DM roster. ensure_chat_room_for_group creates chat_rooms when a group is inserted. ChatListScreen reads chat_room_summaries + chat_unread_counts. ChatRoomScreen sends text/voice/image/video/file, replies (same room check), reactions (toggle_message_reaction), and marks reads. Soft delete sets is_deleted. Content check constraint: text needs text_content; media types need media_url.

There is no separate 1-1 student–teacher table. A “direct” feel happens because a small group still shares one room. Typing indicators are not a first-class table in the recovered schema — if you add them, use a Realtime broadcast channel, not a row per keystroke.

**TASK — 23.1 Group chat fidelity**
Two members send text. One sends an image (chat-images path). One replies. Both toggle a reaction. Unread badge on the other user drops after they open the room. Delete a message — others see deleted state, not the old text.

**CHECKPOINT — Independent verification**
A third user not in the group cannot SELECT chat_messages for that room_id (RLS). Storage 403 if they guess the path. member_count = students + 1.

## Common mistakes

**WARNING — Creating chat_rooms in Flutter instead of the trigger**
You will get duplicates or miss rooms.

## What you just learned

- One room per group, media paths, unread RPC, reactions RPC.

## Self-check quiz (cover the answers)

**Q1.** What view feeds the chat list?

**Answer 1**
chat_room_summaries

# Tutorial 24 — Attendance feature (complete)

| Field | Value |
|---|---|
| Tutorial | 24 — Attendance |
| Difficulty | ★★★★ medium |
| Time | 90 minutes |
| Prerequisites | Tutorials 10–15 |
| Verify yourself | Every TASK has an independent CHECKPOINT. Do not skip it. |

Teachers open TeacherAttendanceScreen, pick a group and date. ensure_lesson_session(group, date) returns/creates lesson_sessions. Attendance rows upsert status: present, absent, late, excused. Unique (group, student, date) and unique (session, student). Students see a calendar (AttendanceCalendarGrid). Analytics charts aggregate percentages. There is no parent-push integration; a parent-facing notification would be a new notifications.kind plus a product decision.

**TASK — 24.1 Roll call**
Mark a class mixed present/absent/late. Change one student to excused. SQL: one lesson_sessions row, N attendance rows. Student calendar matches. Teacher analytics shows a sane percentage.

**CHECKPOINT — Independent verification**
Re-opening the same date does not create a second session (UNIQUE group_id, session_date). A teacher of another group cannot write this group's attendance (RLS).

## Common mistakes

**WARNING — Inserting attendance without a session**
session_id is NOT NULL.

## What you just learned

- Session + status enum + student calendar.

## Self-check quiz (cover the answers)

**Q1.** Which RPC starts the day?

**Answer 1**
ensure_lesson_session

# Tutorial 25 — Announcements feature (complete)

| Field | Value |
|---|---|
| Tutorial | 25 — Announcements |
| Difficulty | ★★★ easy |
| Time | 60 minutes |
| Prerequisites | Tutorials 10–16 |
| Verify yourself | Every TASK has an independent CHECKPOINT. Do not skip it. |

announcements belong to a group. teacher_id is nullable so an admin school-wide post can omit a teacher. image_urls and file_urls are jsonb arrays. TeacherAnnouncementsScreen and AdminAnnouncementsScreen insert rows and upload attachments to the announcements bucket. trg_announcement_notify inserts inbox rows. Student dashboard ExpandableAnnouncementCard reads announcementsProvider.

There is no announcements_reads table. “Read” is approximated by opening the card or by the related notification.is_read. If you need true per-student read receipts for announcements, that is a new table — do not overload message_reads.

**TASK — 25.1 Post and receive**
Teacher posts a title + description + one image. Students in that group see it on the dashboard and get a notification. Students in another group do not. Admin can post to a selected group from the admin announcements screen.

**CHECKPOINT — Independent verification**
SQL: announcements.group_id matches. notifications.kind/action_path point at the announcement. Storage object is not world-listable. Out-of-group student SELECT returns zero rows for that id.

## Common mistakes

**WARNING — Putting school-wide news in a random student’s group**
Admins still pick a group_id; plan which group is “all school” or post per group.

## What you just learned

- Group-scoped posts, jsonb URLs, notify trigger.

## Self-check quiz (cover the answers)

**Q1.** Can teacher_id be null?

**Answer 1**
Yes — admin posts.

# Tier 7 — Going deep

Reusable widgets, tests, performance, errors, and shipping a release artifact.

# Tutorial 26 — Custom widgets and components

| Field | Value |
|---|---|
| Tutorial | 26 — Custom widgets |
| Difficulty | ★★★★ medium |
| Time | 60 minutes |
| Prerequisites | Tutorial 7 |
| Verify yourself | Every TASK has an independent CHECKPOINT. Do not skip it. |

lib/components/ is the widget library: AppShell, ShellNavBar, PremiumCard, EmptyState, PrimaryButton, GroupSelector, AttachmentPreview, VoiceNoteField, MarkAverageCard, AttendanceCalendarGrid, chat bubbles, PDF viewer sheet, analytics charts. Screens should compose these instead of restyling ListTile fifty times.

Good components take data + callbacks (Assignment-like cards take onTap). They do not call supabase themselves. If a card fetches, you cannot reuse it in a test without a fake backend.

**TASK — 26.1 Inventory and reuse**
List ten components and the screens that use them. Build a practice StudentProfileCard in a scratch file that only takes Profile. Then compare to ProfileHeroCard. Note what you missed (style tokens, l10n, avatar cache).

**CHECKPOINT — Independent verification**
Your practice card has no supabase import. flutter analyze on the scratch file is clean. You can point to AppShell as the reason student/teacher/admin feel like one product.

## Common mistakes

**WARNING — Copy-pasting MessageBubble into three role folders**
Chat is already shared.

## What you just learned

- Composition, props vs fetch, shared shell.

## Self-check quiz (cover the answers)

**Q1.** Where does bottom nav live?

**Answer 1**
lib/components/layouts/ — AppShell + ShellNavBar.

# Tutorial 27 — Testing

| Field | Value |
|---|---|
| Tutorial | 27 — Testing |
| Difficulty | ★★★★★ hard |
| Time | 90 minutes |
| Prerequisites | Tutorials 6 and 10 |
| Verify yourself | Every TASK has an independent CHECKPOINT. Do not skip it. |

## Video resources

Watch at least one video before the task. Videos teach the general technology; this book teaches how MU Study uses that technology. Pause the video and map each concept onto a file in this repository.

| Resource | URL |
|---|---|
| Flutter Testing — Official | https://www.youtube.com/watch?v=X8uCMbpnb5s |

This repo already has test/widget_test.dart (SetupRequiredScreen), test/emoji_message_test.dart, and test/shell_layout_test.dart. They run without Supabase. That is the correct default: unit/widget tests mock or avoid the network. Integration tests that log in to a live project belong in a separate CI job with secrets.

**test/widget_test.dart (real)**

```
testWidgets('Setup screen shows configuration hint', (tester) async {
  await tester.pumpWidget(const SetupRequiredScreen());
  expect(find.textContaining('Supabase is not configured'), findsOneWidget);
});
```

For models, test assignmentTypeFromString('homework_pack') and fromJson with a fixture map. For AuthRepository, inject a fake supabase is hard — prefer testing pure functions (email normalization, error mapping) and a thin mock around rpc. Do not hit production with widget tests.

**TASK — 27.1 Write tests that belong in this repo**
1) Unit: assignmentTypeToDb / fromString round-trip.
2) Unit: Profile.fromJson missing full_name becomes ''.
3) Widget: SetupRequiredScreen (already exists — run it).
4) Widget: a dummy login form you built in Tutorial 7 (optional).
5) Manual integration checklist: login → dashboard → create assignment (teacher).
Run: flutter test

**CHECKPOINT — Independent verification**
flutter test exits 0. A new unit test fails when you break homework_pack mapping. CI should run flutter test on every PR.

## Common mistakes

**WARNING — Widget test that calls real signInWithPassword**
Flaky, slow, pollutes Auth users.

## What you just learned

- Test without network first. Manual checklist for RLS.

## Self-check quiz (cover the answers)

**Q1.** Why is SetupRequiredScreen easy to test?

> **Answer 1**
> No Supabase init; it is a static widget.

# Tutorial 28 — Performance and optimization

| Field | Value |
|---|---|
| Tutorial | 28 — Performance |
| Difficulty | ★★★★★ hard |
| Time | 60 minutes |
| Prerequisites | Tutorials 10 and 14 |
| Verify yourself | Every TASK has an independent CHECKPOINT. Do not skip it. |

## Video resources

Watch at least one video before the task. Videos teach the general technology; this book teaches how MU Study uses that technology. Pause the video and map each concept onto a file in this repository.

| Resource | URL |
|---|---|
| Flutter Performance — Official | https://www.youtube.com/watch?v=pk05Vmtfl5g |

Riverpod already caches FutureProvider results until invalidate. Lists page (PageResult, LoadMoreButton). Images use cached_network_image and chat_media_cache_service. Selects should name columns when payloads are large (chat list uses a view instead of N+1 queries). Focus and theme reads hit SharedPreferences, not Postgres.

**Habits**

```
- Filter by group_id / user_id in the query, not in Dart after download.
- limit(50) on notifications (already).
- Do not watch a high-churn stream in AppShell if only a badge integer is needed
  (unreadNotificationsCountProvider derives from the list).
- Chat video thumbnails are computed once (chat_video_thumbnail_service).
```

> **TASK — 28.1 Measure one list**
> Open teacher gradebook for a group with many marks. Note the select and whether it pages. If you add a student directory, implement page size 20 and a LoadMoreButton. Confirm DevTools rebuild counts do not rebuild the entire shell on each mark edit.

> **CHECKPOINT — Independent verification**
> Network tab (or Supabase logs) shows bounded payloads. Opening chat does not re-download all academic years. That is a pass.

## Common mistakes

> **WARNING — select() * on chat_messages without room filter**
> You will ship the whole school.

## What you just learned

- Cache, page, filter in SQL, isolate rebuilds.

## Self-check quiz (cover the answers)

**Q1.** Where is offline profile stored?

**Answer 1**
CacheService / SharedPreferences via app_cache.

# Tutorial 29 — Error handling and user feedback

| Field | Value |
|---|---|
| Tutorial | 29 — Errors & feedback |
| Difficulty | ★★★★ medium |
| Time | 50 minutes |
| Prerequisites | Tutorials 10 and 14 |
| Verify yourself | Every TASK has an independent CHECKPOINT. Do not skip it. |

LoginScreen maps AuthException → loginIncorrect, PostgrestException with jwt/key → loginConfigError, other → loginFailed (debug shows the raw error). ProfileRepository catches fetch errors and falls back to cachedProfile. Lists should use AsyncValue.when with a retry that invalidates the provider. Skeletonizer/shimmer packages are in pubspec for loading chrome.

**Pattern**

```
asyncValue.when(
  loading: () => const Skeletonizer(child: PlaceholderList()),
  error: (e, _) => EmptyState(
    title: context.l10n.genericError,
    action: () => ref.invalidate(assignmentsProvider),
  ),
  data: (items) => items.isEmpty ? EmptyState(...) : ListView(...),
);
```

**TASK — 29.1 Break the network on purpose**
Airplane mode on a logged-in student. Open marks — cached or friendly error, not a red screen of death. Turn network on, tap retry. Wrong login password — no exception dump in release. Invalid anon key — SetupRequired or loginConfigError, not a hang.

**CHECKPOINT — Independent verification**
A non-developer testers' notes: they always saw a sentence in their language and a next action (retry, contact admin). If they saw PostgrestException, you leaked internals.

## Common mistakes

**WARNING — catch (_) {}**
You hide RLS bugs. Log in debug, show l10n in release.

## What you just learned

- Typed errors, cache fallback, retry, empty vs error.

## Self-check quiz (cover the answers)

**Q1.** What does LoginScreen do after a successful sign-in?

**Answer 1**
invalidate currentProfileProvider and context.go('/boot').

# Tutorial 30 — Deployment to app stores and web

| Field | Value |
|---|---|
| Tutorial | 30 — Deployment |
| Difficulty | ★★★★★ hard |
| Time | 120 minutes |
| Prerequisites | All previous tutorials |
| Verify yourself | Every TASK has an independent CHECKPOINT. Do not skip it. |

## Video resources

Watch at least one video before the task. Videos teach the general technology; this book teaches how MU Study uses that technology. Pause the video and map each concept onto a file in this repository.

| Resource | URL |
|---|---|
| Flutter Release Builds — Official | https://www.youtube.com/watch?v=Yx1kSisJo4k |

Makefile apk target: flutter build apk --release then copies to mu_study.apk. Web: flutter build web (and make ch for Chrome debug). iOS: flutter build ipa requires Apple developer membership, signing, and bundle com.example.muStudy — change the bundle before a real store listing.

Store listing is an organizational process (screenshots, privacy policy, age ratings, data-safety forms). This book cannot create your Play Console or App Store Connect accounts. It can demand hygiene: no service_role, production Supabase project, Auth site URL allow-list, Syncfusion license if required, real passwords instead of password123, microphone/photo purpose strings that match what you actually record.

**Release commands**

```
flutter test
flutter build apk --release --dart-define-from-file=.env.production
flutter build web --release --dart-define-from-file=.env.production
flutter build ipa --release --dart-define-from-file=.env.production
```

**TASK — 30.1 Produce artifacts (local)**
1) flutter test passes.
2) flutter build apk --release succeeds; install on a phone and log in against YOUR project.
3) flutter build web succeeds; serve build/web and log in.
4) Write a one-page launch checklist: rotate demo passwords, confirm RLS with two students, confirm Storage 403, confirm Auth redirect URLs.
Uploading to stores is optional and account-specific — do not paste store keys here.

**CHECKPOINT — Independent verification**
The APK/web build logs in without SetupRequiredScreen. strings.xml / Info.plist usage descriptions exist. .env.production is not in git. A second student still cannot see the first student's marks on the release build — RLS does not care about Debug.

## Common mistakes

**WARNING — Shipping the development project URL to the world with password123**
Read the README warning again.

**WARNING — Debug signing as a Play Store AAB**
Play requires a real upload keystore.

## What you just learned

- Release builds, secrets, store process vs engineering artifacts.

## Self-check quiz (cover the answers)

**Q1.** What Makefile target copies the APK?

**Answer 1**
make apk

**Q2.** Why dart-define-from-file on release?

**Answer 2**
Inject URL/key without relying on a bundled .env you might forget to strip.

**You finished the 30 tutorials**
The source atlas and SQL atlas after this page are the reconstruction encyclopedia. Use them when a lesson said “open file X” and you want the entire listing. Score yourself with Appendix K quizzes and the feature checkpoints — not with page count.

# Source atlas — every application Dart file

This atlas is the reconstruction reference. For each file: why it exists, how to read it, the complete listing, and five questions you can answer without running the app. Generated localization files are omitted (run flutter gen-l10n instead).

File count in this atlas: **155**.

## lib/components/analytics/teacher_analytics_charts.dart

Application source used by MU Study. Read the imports first, then the public types, then the widget build or provider body.

Line count: 377. Import count: 6. Read imports to learn dependencies, then scan for class / provider names, then read the first public method end-to-end.

- import 'package:flutter/material.dart';
- import 'package:mu_study/core/theme/app_colors.dart';
- import 'package:mu_study/core/theme/app_style_tokens.dart';
- import 'package:mu_study/l10n/l10n_x.dart';

**How to study this file**
1) Name the layer (screen / provider / model / widget / service).
2) List the tables or RPCs it touches (search for .from( and .rpc().
3) List the providers it watches or invalidates.
4) Predict what breaks if this file is deleted.
5) Only then read the listing below.

## Comprehension

1. What user role(s) can reach the behavior in lib/components/analytics/teacher_analytics_charts.dart?
2. Which database table or RPC would you inspect in Supabase to debug it?
3. Does it hold UI, state, or both? Why was that choice made?
4. What happens offline — cache, error, or empty?
5. Name one widget or provider that would break if this file's public API changed.

## lib/components/attachments/attachment_preview.dart

Application source used by MU Study. Read the imports first, then the public types, then the widget build or provider body.

Line count: 515. Import count: 7. Read imports to learn dependencies, then scan for class / provider names, then read the first public method end-to-end.

## Comprehension

1. What user role(s) can reach the behavior in lib/components/attachments/attachment_preview.dart?
2. Which database table or RPC would you inspect in Supabase to debug it?
3. Does it hold UI, state, or both? Why was that choice made?
4. What happens offline — cache, error, or empty?
5. Name one widget or provider that would break if this file's public API changed.

## lib/components/attachments/voice_note_field.dart

Application source used by MU Study. Read the imports first, then the public types, then the widget build or provider body.

Line count: 615. Import count: 10. Read imports to learn dependencies, then scan for class / provider names, then read the first public method end-to-end.

> **How to study this file**
> 1) Name the layer (screen / provider / model / widget / service).
> 2) List the tables or RPCs it touches (search for .from( and .rpc().
> 3) List the providers it watches or invalidates.
> 4) Predict what breaks if this file is deleted.
> 5) Only then read the listing below.

## Comprehension

1. What user role(s) can reach the behavior in lib/components/backgrounds/nature_paper_backdrop.dart?
2. Which database table or RPC would you inspect in Supabase to debug it?
3. Does it hold UI, state, or both? Why was that choice made?
4. What happens offline — cache, error, or empty?
5. Name one widget or provider that would break if this file’s public API changed.

## lib/components/backgrounds/soft_neumorphism_backdrop.dart

Application source used by MU Study. Read the imports first, then the public types, then the widget build or provider body.

Line count: 170. Import count: 3. Read imports to learn dependencies, then scan for class / provider names, then read the first public method end-to-end.

- import 'package:flutter/material.dart';
- import 'package:mu_study/core/theme/app_style_tokens.dart';
- import 'package:mu_study/core/theme/soft_neumorphism_colors.dart';

**How to study this file**
1) Name the layer (screen / provider / model / widget / service).
2) List the tables or RPCs it touches (search for .from( and .rpc().
3) List the providers it watches or invalidates.
4) Predict what breaks if this file is deleted.
5) Only then read the listing below.

**lib/components/backgrounds/soft_neumorphism_backdrop.dart**

```
import 'package:flutter/material.dart';
import 'package:mu_study/core/theme/app_style_tokens.dart';
import 'package:mu_study/core/theme/soft_neumorphism_colors.dart';

## Comprehension

1. What user role(s) can reach the behavior in lib/components/chat/chat_media_gallery.dart?
2. Which database table or RPC would you inspect in Supabase to debug it?
3. Does it hold UI, state, or both? Why was that choice made?
4. What happens offline — cache, error, or empty?
5. Name one widget or provider that would break if this file's public API changed.

## lib/components/decor/paper_decor.dart

Application source used by MU Study. Read the imports first, then the public types, then the widget build or provider body.

Line count: 510. Import count: 4. Read imports to learn dependencies, then scan for class / provider names, then read the first public method end-to-end.

- import 'package:flutter/material.dart';
- import 'package:mu_study/core/theme/app_colors.dart';
- import 'package:mu_study/core/theme/app_style_tokens.dart';
- import 'package:mu_study/core/theme/nature_paper_colors.dart';

**How to study this file**
1) Name the layer (screen / provider / model / widget / service).
2) List the tables or RPCs it touches (search for .from( and .rpc().
3) List the providers it watches or invalidates.
4) Predict what breaks if this file is deleted.
5) Only then read the listing below.

## Comprehension

1. What user role(s) can reach the behavior in lib/components/decor/paper_decor.dart?
2. Which database table or RPC would you inspect in Supabase to debug it?
3. Does it hold UI, state, or both? Why was that choice made?
4. What happens offline — cache, error, or empty?
5. Name one widget or provider that would break if this file's public API changed.

## lib/components/decor/sidebar_grove.dart

Application source used by MU Study. Read the imports first, then the public types, then the widget build or provider body.

Line count: 352. Import count: 3. Read imports to learn dependencies, then scan for class / provider names, then read the first public method end-to-end.

- import 'dart:math' as math;
- import 'package:flutter/material.dart';
- import 'package:mu_study/components/decor/paper_decor.dart';

**How to study this file**
1) Name the layer (screen / provider / model / widget / service).
2) List the tables or RPCs it touches (search for .from( and .rpc().
3) List the providers it watches or invalidates.
4) Predict what breaks if this file is deleted.
5) Only then read the listing below.

**lib/components/decor/sidebar_grove.dart**

## Comprehension

1. What user role(s) can reach the behavior in lib/components/inputs/group_selector.dart?
2. Which database table or RPC would you inspect in Supabase to debug it?
3. Does it hold UI, state, or both? Why was that choice made?
4. What happens offline — cache, error, or empty?
5. Name one widget or provider that would break if this file’s public API changed.

## lib/components/inputs/load_more_button.dart

Application source used by MU Study. Read the imports first, then the public types, then the widget build or provider body.

Line count: 43. Import count: 3. Read imports to learn dependencies, then scan for class / provider names, then read the first public method end-to-end.

- import 'package:flutter/material.dart';
- import 'package:mu_study/core/theme/app_colors.dart';
- import 'package:mu_study/l10n/l10n_x.dart';

**How to study this file**
1) Name the layer (screen / provider / model / widget / service).
2) List the tables or RPCs it touches (search for .from( and .rpc().
3) List the providers it watches or invalidates.
4) Predict what breaks if this file is deleted.
5) Only then read the listing below.

```

## Comprehension

1. What user role(s) can reach the behavior in lib/components/layouts/shell_nav_bar.dart?
2. Which database table or RPC would you inspect in Supabase to debug it?
3. Does it hold UI, state, or both? Why was that choice made?
4. What happens offline — cache, error, or empty?
5. Name one widget or provider that would break if this file’s public API changed.

## lib/components/marks/mark_average_card.dart

Application source used by MU Study. Read the imports first, then the public types, then the widget build or provider body.

Line count: 121. Import count: 6. Read imports to learn dependencies, then scan for class / provider names, then read the first public method end-to-end.

- import 'package:flutter/material.dart';
- import 'package:mu_study/components/cards/premium_card.dart';
- import 'package:mu_study/components/decor/paper_decor.dart';
- import 'package:mu_study/components/marks/percent_badge.dart';

- import 'package:mu_study/l10n/l10n_x.dart';

> **How to study this file**
> 1) Name the layer (screen / provider / model / widget / service).
> 2) List the tables or RPCs it touches (search for .from( and .rpc().
> 3) List the providers it watches or invalidates.
> 4) Predict what breaks if this file is deleted.
> 5) Only then read the listing below.

4. What happens offline — cache, error, or empty?
5. Name one widget or provider that would break if this file’s public API changed.

## lib/core/constants/env.dart

Compile-time and runtime configuration (Env). This file (env) is one concrete piece of that layer.

Line count: 51. Import count: 1. Read imports to learn dependencies, then scan for class / provider names, then read the first public method end-to-end.

- import 'package:flutter_dotenv/flutter_dotenv.dart';

**How to study this file**
1) Name the layer (screen / provider / model / widget / service).
2) List the tables or RPCs it touches (search for .from( and .rpc().
3) List the providers it watches or invalidates.
4) Predict what breaks if this file is deleted.
5) Only then read the listing below.

**lib/core/constants/env.dart**

```
import 'package:flutter_dotenv/flutter_dotenv.dart';

class Env {
  static const _defaultUrl = 'https://nmmdvdprczukaskxxdrs.supabase.co';
  static const _placeholderKey = 'your_anon_key_here';

  static String supabaseUrl = _defaultUrl;
  static String supabaseAnonKey = '';

## Comprehension

1. What user role(s) can reach the behavior in lib/core/progress/progress_report.dart?
2. Which database table or RPC would you inspect in Supabase to debug it?
3. Does it hold UI, state, or both? Why was that choice made?
4. What happens offline — cache, error, or empty?
5. Name one widget or provider that would break if this file's public API changed.

## lib/core/progress/progress_report_pdf.dart

Student progress report model + PDF + share. This file (progress report pdf) is one concrete piece of that layer.

Line count: 135. Import count: 7. Read imports to learn dependencies, then scan for class / provider names, then read the first public method end-to-end.

- import 'dart:typed_data';
- import 'package:flutter/material.dart' show Rect, Offset;
- import 'package:intl/intl.dart';
- import 'package:mu_study/core/progress/progress_report.dart';
- import 'package:mu_study/l10n/app_localizations.dart';
- import 'package:mu_study/l10n/domain_labels.dart';
- import 'package:syncfusion_flutter_pdf/pdf.dart';

**How to study this file**
1) Name the layer (screen / provider / model / widget / service).
2) List the tables or RPCs it touches (search for .from( and .rpc().
3) List the providers it watches or invalidates.
4) Predict what breaks if this file is deleted.
5) Only then read the listing below.

**lib/core/progress/progress_report_pdf.dart**

## Comprehension

1. What user role(s) can reach the behavior in lib/core/theme/app_style_tokens.dart?
2. Which database table or RPC would you inspect in Supabase to debug it?
3. Does it hold UI, state, or both? Why was that choice made?
4. What happens offline — cache, error, or empty?
5. Name one widget or provider that would break if this file's public API changed.

## lib/core/theme/app_text_theme.dart

Four visual styles × light/dark Material 3 themes. This file (app text theme) is one concrete piece of that layer.

Line count: 70. Import count: 2. Read imports to learn dependencies, then scan for class / provider names, then read the first public method end-to-end.

- import 'package:flutter/material.dart';
- import 'package:google_fonts/google_fonts.dart';

> **How to study this file**
> 1) Name the layer (screen / provider / model / widget / service).
> 2) List the tables or RPCs it touches (search for .from( and .rpc().
> 3) List the providers it watches or invalidates.
> 4) Predict what breaks if this file is deleted.
> 5) Only then read the listing below.

**lib/core/theme/app_text_theme.dart**

```

## Comprehension

1. What user role(s) can reach the behavior in lib/core/theme/app_theme.dart?
2. Which database table or RPC would you inspect in Supabase to debug it?
3. Does it hold UI, state, or both? Why was that choice made?
4. What happens offline — cache, error, or empty?
5. Name one widget or provider that would break if this file’s public API changed.

## lib/core/theme/monochrome_workspace_colors.dart

Four visual styles × light/dark Material 3 themes. This file (monochrome workspace colors) is one concrete piece of that layer.

Line count: 47. Import count: 1. Read imports to learn dependencies, then scan for class / provider names, then read the first public method end-to-end.

- import 'package:flutter/material.dart';

> **How to study this file**
> 1) Name the layer (screen / provider / model / widget / service).
> 2) List the tables or RPCs it touches (search for .from( and .rpc().
> 3) List the providers it watches or invalidates.
> 4) Predict what breaks if this file is deleted.
> 5) Only then read the listing below.

**lib/core/theme/monochrome_workspace_colors.dart**

## Comprehension

1. What user role(s) can reach the behavior in lib/core/theme/monochrome_workspace_theme.dart?
2. Which database table or RPC would you inspect in Supabase to debug it?
3. Does it hold UI, state, or both? Why was that choice made?
4. What happens offline — cache, error, or empty?
5. Name one widget or provider that would break if this file’s public API changed.

## lib/core/theme/nature_paper_colors.dart

Four visual styles × light/dark Material 3 themes. This file (nature paper colors) is one concrete piece of that layer.

Line count: 42. Import count: 1. Read imports to learn dependencies, then scan for class / provider names, then read the first public method end-to-end.

- import 'package:flutter/material.dart';

> **How to study this file**
> 1) Name the layer (screen / provider / model / widget / service).
> 2) List the tables or RPCs it touches (search for .from( and .rpc().
> 3) List the providers it watches or invalidates.
> 4) Predict what breaks if this file is deleted.
> 5) Only then read the listing below.

**lib/core/theme/nature_paper_colors.dart**

```

## Comprehension

1. What user role(s) can reach the behavior in lib/core/theme/nature_paper_theme.dart?
2. Which database table or RPC would you inspect in Supabase to debug it?
3. Does it hold UI, state, or both? Why was that choice made?
4. What happens offline — cache, error, or empty?
5. Name one widget or provider that would break if this file's public API changed.

## lib/core/theme/neumorphic.dart

Four visual styles × light/dark Material 3 themes. This file (neumorphic) is one concrete piece of that layer.

Line count: 403. Import count: 6. Read imports to learn dependencies, then scan for class / provider names, then read the first public method end-to-end.

- import 'package:flutter/material.dart';
- import 'package:mu_study/components/decor/paper_decor.dart';
- import 'package:mu_study/core/theme/app_colors.dart';
- import 'package:mu_study/core/theme/app_style_tokens.dart';
- import 'package:mu_study/core/theme/nature_paper_colors.dart';
- import 'package:mu_study/core/theme/soft_neumorphism_colors.dart';

**How to study this file**
1) Name the layer (screen / provider / model / widget / service).
2) List the tables or RPCs it touches (search for .from( and .rpc().
3) List the providers it watches or invalidates.
4) Predict what breaks if this file is deleted.
5) Only then read the listing below.

## Comprehension

1. What user role(s) can reach the behavior in lib/providers/attendance/attendance_providers.dart?
2. Which database table or RPC would you inspect in Supabase to debug it?

3. Does it hold UI, state, or both? Why was that choice made?
4. What happens offline — cache, error, or empty?
5. Name one widget or provider that would break if this file's public API changed.

## lib/providers/auth/auth_provider.dart

Session stream, username login RPC, profile/teacher/student loaders. This file (auth provider) is one concrete piece of that layer.

Line count: 119. Import count: 6. Read imports to learn dependencies, then scan for class / provider names, then read the first public method end-to-end.

- import 'package:flutter_riverpod/flutter_riverpod.dart';
- import 'package:mu_study/core/services/app_cache.dart';
- import 'package:mu_study/core/services/cache_service.dart';
- import 'package:mu_study/models/models.dart';
- import 'package:mu_study/supabase/supabase_client.dart';
- import 'package:supabase_flutter/supabase_flutter.dart';

**How to study this file**
1) Name the layer (screen / provider / model / widget / service).
2) List the tables or RPCs it touches (search for .from( and .rpc().
3) List the providers it watches or invalidates.
4) Predict what breaks if this file is deleted.
5) Only then read the listing below.

## Comprehension

1. What user role(s) can reach the behavior in lib/providers/chat/chat_providers.dart?
2. Which database table or RPC would you inspect in Supabase to debug it?
3. Does it hold UI, state, or both? Why was that choice made?
4. What happens offline — cache, error, or empty?
5. Name one widget or provider that would break if this file’s public API changed.

## lib/providers/focus/focus_session_provider.dart

Local Pomodoro/free timer persisted in SharedPreferences. This file (focus session provider) is one concrete piece of that layer.

Line count: 245. Import count: 5. Read imports to learn dependencies, then scan for class / provider names, then read the first public method end-to-end.

- import 'dart:async';
- import 'dart:convert';
- import 'package:flutter_riverpod/flutter_riverpod.dart';
- import 'package:mu_study/core/focus/focus_time_up_cue.dart';
- import 'package:shared_preferences/shared_preferences.dart';

**How to study this file**
1) Name the layer (screen / provider / model / widget / service).
2) List the tables or RPCs it touches (search for .from( and .rpc().
3) List the providers it watches or invalidates.
4) Predict what breaks if this file is deleted.
5) Only then read the listing below.

```

## Comprehension

1. What user role(s) can reach the behavior in lib/providers/marks/marks_providers.dart?
2. Which database table or RPC would you inspect in Supabase to debug it?
3. Does it hold UI, state, or both? Why was that choice made?
4. What happens offline — cache, error, or empty?
5. Name one widget or provider that would break if this file’s public API changed.

## lib/providers/notifications/notification_providers.dart

Realtime inbox + announcements. This file (notification providers) is one concrete piece of that layer.

Line count: 91. Import count: 7. Read imports to learn dependencies, then scan for class / provider names, then read the first public method end-to-end.

- import 'dart:async';
- import 'package:flutter_riverpod/flutter_riverpod.dart';
- import 'package:supabase_flutter/supabase_flutter.dart';
- import 'package:mu_study/core/services/cache_service.dart';
- import 'package:mu_study/models/models.dart';
- import 'package:mu_study/providers/auth/auth_provider.dart';
- import 'package:mu_study/supabase/supabase_client.dart';

**How to study this file**
1) Name the layer (screen / provider / model / widget / service).
2) List the tables or RPCs it touches (search for .from( and .rpc().
3) List the providers it watches or invalidates.
4) Predict what breaks if this file is deleted.
5) Only then read the listing below.

## Comprehension

1. What user role(s) can reach the behavior in lib/screens/admin/academic_years/admin_academic_years_screen.dart?
2. Which database table or RPC would you inspect in Supabase to debug it?
3. Does it hold UI, state, or both? Why was that choice made?

4. What happens offline — cache, error, or empty?
5. Name one widget or provider that would break if this file's public API changed.

## lib/screens/admin/analytics/admin_analytics_screen.dart

Application source used by MU Study. Read the imports first, then the public types, then the widget build or provider body.

Line count: 85. Import count: 10. Read imports to learn dependencies, then scan for class / provider names, then read the first public method end-to-end.

- import 'package:flutter/material.dart';

**How to study this file**
1) Name the layer (screen / provider / model / widget / service).
2) List the tables or RPCs it touches (search for .from( and .rpc().
3) List the providers it watches or invalidates.
4) Predict what breaks if this file is deleted.
5) Only then read the listing below.

## Comprehension

1. What user role(s) can reach the behavior in lib/screens/admin/credentials/admin_credential_print_screen.dart?
2. Which database table or RPC would you inspect in Supabase to debug it?
3. Does it hold UI, state, or both? Why was that choice made?
4. What happens offline — cache, error, or empty?
5. Name one widget or provider that would break if this file’s public API changed.

## lib/screens/admin/dashboard/admin_dashboard_screen.dart

Application source used by MU Study. Read the imports first, then the public types, then the widget build or provider body.

Line count: 346. Import count: 11. Read imports to learn dependencies, then scan for class / provider names, then read the first public method end-to-end.

- import 'package:flutter/material.dart';

**How to study this file**
1) Name the layer (screen / provider / model / widget / service).
2) List the tables or RPCs it touches (search for .from( and .rpc().
3) List the providers it watches or invalidates.
4) Predict what breaks if this file is deleted.
5) Only then read the listing below.

**How to study this file**
1) Name the layer (screen / provider / model / widget / service).
2) List the tables or RPCs it touches (search for .from( and .rpc().
3) List the providers it watches or invalidates.
4) Predict what breaks if this file is deleted.
5) Only then read the listing below.

## Comprehension

1. What user role(s) can reach the behavior in lib/screens/admin/users/admin_users_screen.dart?
2. Which database table or RPC would you inspect in Supabase to debug it?
3. Does it hold UI, state, or both? Why was that choice made?
4. What happens offline — cache, error, or empty?
5. Name one widget or provider that would break if this file’s public API changed.

## lib/screens/auth/language_selection_screen.dart

Splash, login, language, setup-required, disabled account. This file (language selection screen) is one concrete piece of that layer.

Line count: 266. Import count: 8. Read imports to learn dependencies, then scan for class / provider names, then read the first public method end-to-end.

- import 'package:flutter/material.dart';
- import 'package:flutter_riverpod/flutter_riverpod.dart';
- import 'package:go_router/go_router.dart';
- import 'package:mu_study/core/locale/app_locale.dart';
- import 'package:mu_study/core/theme/app_colors.dart';
- import 'package:mu_study/l10n/l10n_x.dart';
- import 'package:mu_study/providers/auth/auth_provider.dart';
- import 'package:mu_study/providers/settings/locale_provider.dart';

**How to study this file**
1) Name the layer (screen / provider / model / widget / service).
2) List the tables or RPCs it touches (search for .from( and .rpc().
3) List the providers it watches or invalidates.
4) Predict what breaks if this file is deleted.
5) Only then read the listing below.

```

## Comprehension

1. What user role(s) can reach the behavior in lib/screens/auth/language_selection_screen.dart?
2. Which database table or RPC would you inspect in Supabase to debug it?
3. Does it hold UI, state, or both? Why was that choice made?
4. What happens offline — cache, error, or empty?
5. Name one widget or provider that would break if this file's public API changed.

## lib/screens/auth/login_screen.dart

Splash, login, language, setup-required, disabled account. This file (login screen) is one concrete piece of that layer.

Line count: 450. Import count: 13. Read imports to learn dependencies, then scan for class / provider names, then read the first public method end-to-end.

- import 'dart:math' as math;
- import 'package:flutter/foundation.dart';
- import 'package:flutter/material.dart';
- import 'package:flutter_riverpod/flutter_riverpod.dart';
- import 'package:go_router/go_router.dart';
- import 'package:supabase_flutter/supabase_flutter.dart';
- import 'package:mu_study/components/brand/app_logo.dart';
- import 'package:mu_study/components/buttons/primary_button.dart';
- import 'package:mu_study/components/decor/paper_decor.dart';
- import 'package:mu_study/core/constants/env.dart';
- import 'package:mu_study/core/theme/app_colors.dart';
- import 'package:mu_study/l10n/l10n_x.dart';
- import 'package:mu_study/providers/auth/auth_provider.dart';

**How to study this file**
1) Name the layer (screen / provider / model / widget / service).
2) List the tables or RPCs it touches (search for .from( and .rpc().
3) List the providers it watches or invalidates.
4) Predict what breaks if this file is deleted.
5) Only then read the listing below.

**lib/screens/auth/login_screen.dart**

## Comprehension

1. What user role(s) can reach the behavior in lib/screens/auth/login_screen.dart?
2. Which database table or RPC would you inspect in Supabase to debug it?
3. Does it hold UI, state, or both? Why was that choice made?
4. What happens offline — cache, error, or empty?
5. Name one widget or provider that would break if this file's public API changed.

## lib/screens/auth/setup_required_screen.dart

Splash, login, language, setup-required, disabled account. This file (setup required screen) is one concrete piece of that layer.

Line count: 81. Import count: 5. Read imports to learn dependencies, then scan for class / provider names, then read the first public method end-to-end.

- import 'package:flutter/material.dart';
- import 'package:flutter_localizations/flutter_localizations.dart';
- import 'package:mu_study/core/theme/app_colors.dart';
- import 'package:mu_study/core/theme/app_theme.dart';
- import 'package:mu_study/l10n/l10n_x.dart';

**How to study this file**
1) Name the layer (screen / provider / model / widget / service).
2) List the tables or RPCs it touches (search for .from( and .rpc().
3) List the providers it watches or invalidates.
4) Predict what breaks if this file is deleted.
5) Only then read the listing below.

```

## Comprehension

1. What user role(s) can reach the behavior in lib/screens/chat/list/chat_list_screen.dart?
2. Which database table or RPC would you inspect in Supabase to debug it?
3. Does it hold UI, state, or both? Why was that choice made?
4. What happens offline — cache, error, or empty?
5. Name one widget or provider that would break if this file’s public API changed.

## lib/screens/chat/room/chat_room_screen.dart

Application source used by MU Study. Read the imports first, then the public types, then the widget build or provider body.

Line count: 1605. Import count: 27. Read imports to learn dependencies, then scan for class / provider names, then read the first public method end-to-end.

> **How to study this file**
> 1) Name the layer (screen / provider / model / widget / service).
> 2) List the tables or RPCs it touches (search for .from( and .rpc().
> 3) List the providers it watches or invalidates.
> 4) Predict what breaks if this file is deleted.
> 5) Only then read the listing below.

```

## Comprehension

1. What user role(s) can reach the behavior in lib/screens/chat/room/widgets/swipe_to_reply.dart?
2. Which database table or RPC would you inspect in Supabase to debug it?
3. Does it hold UI, state, or both? Why was that choice made?
4. What happens offline — cache, error, or empty?
5. Name one widget or provider that would break if this file's public API changed.

## lib/screens/profile/app_profile_screen.dart

Shared profile (theme, language, password, logout). This file (app profile screen) is one concrete piece of that layer.

Line count: 747. Import count: 28. Read imports to learn dependencies, then scan for class / provider names, then read the first public method end-to-end.

> **How to study this file**
> 1) Name the layer (screen / provider / model / widget / service).
> 2) List the tables or RPCs it touches (search for .from( and .rpc().
> 3) List the providers it watches or invalidates.
> 4) Predict what breaks if this file is deleted.
> 5) Only then read the listing below.

## Comprehension

1. What user role(s) can reach the behavior in lib/screens/profile/app_profile_screen.dart?
2. Which database table or RPC would you inspect in Supabase to debug it?
3. Does it hold UI, state, or both? Why was that choice made?
4. What happens offline — cache, error, or empty?
5. Name one widget or provider that would break if this file’s public API changed.

## lib/screens/profile/widgets/profile_hero_card.dart

Application source used by MU Study. Read the imports first, then the public types, then the widget build or provider body.

Line count: 201. Import count: 5. Read imports to learn dependencies, then scan for class / provider names, then read the first public method end-to-end.

- import 'package:cached_network_image/cached_network_image.dart';
- import 'package:flutter/material.dart';
- import 'package:mu_study/components/decor/paper_decor.dart';
- import 'package:mu_study/core/theme/app_colors.dart';
- import 'package:mu_study/models/models.dart';

**How to study this file**
1) Name the layer (screen / provider / model / widget / service).
2) List the tables or RPCs it touches (search for .from( and .rpc().
3) List the providers it watches or invalidates.
4) Predict what breaks if this file is deleted.
5) Only then read the listing below.

## Comprehension

1. What user role(s) can reach the behavior in lib/screens/student/home/student_dashboard_screen.dart?
2. Which database table or RPC would you inspect in Supabase to debug it?
3. Does it hold UI, state, or both? Why was that choice made?
4. What happens offline — cache, error, or empty?
5. Name one widget or provider that would break if this file's public API changed.

## lib/screens/student/home/widgets/dashboard_announcements.dart

Application source used by MU Study. Read the imports first, then the public types, then the widget build or provider body.

Line count: 68. Import count: 4. Read imports to learn dependencies, then scan for class / provider names, then read the first public method end-to-end.

- import 'package:flutter/material.dart';
- import 'package:mu_study/l10n/l10n_x.dart';
- import 'package:mu_study/models/models.dart';
- import 'package:mu_study/screens/student/home/widgets/expandable_announcement_card.dart';

**How to study this file**
1) Name the layer (screen / provider / model / widget / service).
2) List the tables or RPCs it touches (search for .from( and .rpc().
3) List the providers it watches or invalidates.
4) Predict what breaks if this file is deleted.
5) Only then read the listing below.

```

## Comprehension

1. What user role(s) can reach the behavior in lib/screens/student/home/widgets/expandable_announcement_card.dart?
2. Which database table or RPC would you inspect in Supabase to debug it?
3. Does it hold UI, state, or both? Why was that choice made?
4. What happens offline — cache, error, or empty?
5. Name one widget or provider that would break if this file's public API changed.

## lib/screens/student/homework/student_assignments_screen.dart

Application source used by MU Study. Read the imports first, then the public types, then the widget build or provider body.

Line count: 371. Import count: 17. Read imports to learn dependencies, then scan for class / provider names, then read the first public method end-to-end.

> **How to study this file**
> 1) Name the layer (screen / provider / model / widget / service).
> 2) List the tables or RPCs it touches (search for .from( and .rpc().
> 3) List the providers it watches or invalidates.
> 4) Predict what breaks if this file is deleted.
> 5) Only then read the listing below.

```

## Comprehension

1. What user role(s) can reach the behavior in lib/screens/student/homework/student_assignments_screen.dart?
2. Which database table or RPC would you inspect in Supabase to debug it?
3. Does it hold UI, state, or both? Why was that choice made?
4. What happens offline — cache, error, or empty?
5. Name one widget or provider that would break if this file's public API changed.

## lib/screens/student/homework/student_task_submit_screen.dart

Application source used by MU Study. Read the imports first, then the public types, then the widget build or provider body.

Line count: 506. Import count: 18. Read imports to learn dependencies, then scan for class / provider names, then read the first public method end-to-end.

> **How to study this file**
> 1) Name the layer (screen / provider / model / widget / service).
> 2) List the tables or RPCs it touches (search for .from( and .rpc().
> 3) List the providers it watches or invalidates.
> 4) Predict what breaks if this file is deleted.
> 5) Only then read the listing below.

## Comprehension

1. What user role(s) can reach the behavior in lib/screens/student/notifications/student_notifications_screen.dart?
2. Which database table or RPC would you inspect in Supabase to debug it?
3. Does it hold UI, state, or both? Why was that choice made?
4. What happens offline — cache, error, or empty?
5. Name one widget or provider that would break if this file’s public API changed.

# lib/screens/student/profile/student_profile_screen.dart

Application source used by MU Study. Read the imports first, then the public types, then the widget build or provider body.

Line count: 12. Import count: 3. Read imports to learn dependencies, then scan for class / provider names, then read the first public method end-to-end.

- import 'package:flutter/material.dart';
- import 'package:flutter_riverpod/flutter_riverpod.dart';
- import 'package:mu_study/screens/profile/app_profile_screen.dart';

**How to study this file**
1) Name the layer (screen / provider / model / widget / service).
2) List the tables or RPCs it touches (search for .from( and .rpc().
3) List the providers it watches or invalidates.
4) Predict what breaks if this file is deleted.
5) Only then read the listing below.

## Comprehension

1. What user role(s) can reach the behavior in lib/screens/teacher/announcements/teacher_announcements_screen.dart?
2. Which database table or RPC would you inspect in Supabase to debug it?
3. Does it hold UI, state, or both? Why was that choice made?
4. What happens offline — cache, error, or empty?
5. Name one widget or provider that would break if this file's public API changed.

## lib/screens/teacher/assignments/teacher_assignments_screen.dart

Application source used by MU Study. Read the imports first, then the public types, then the widget build or provider body.

Line count: 874. Import count: 21. Read imports to learn dependencies, then scan for class / provider names, then read the first public method end-to-end.

**How to study this file**
1) Name the layer (screen / provider / model / widget / service).
2) List the tables or RPCs it touches (search for .from( and .rpc().
3) List the providers it watches or invalidates.
4) Predict what breaks if this file is deleted.
5) Only then read the listing below.

```

## Comprehension

1. What user role(s) can reach the behavior in lib/screens/teacher/assignments/teacher_assignments_screen.dart?
2. Which database table or RPC would you inspect in Supabase to debug it?
3. Does it hold UI, state, or both? Why was that choice made?
4. What happens offline — cache, error, or empty?
5. Name one widget or provider that would break if this file's public API changed.

## lib/screens/teacher/attendance/teacher_attendance_screen.dart

Application source used by MU Study. Read the imports first, then the public types, then the widget build or provider body.

Line count: 819. Import count: 14. Read imports to learn dependencies, then scan for class / provider names, then read the first public method end-to-end.

**How to study this file**
1) Name the layer (screen / provider / model / widget / service).
2) List the tables or RPCs it touches (search for .from( and .rpc().
3) List the providers it watches or invalidates.
4) Predict what breaks if this file is deleted.
5) Only then read the listing below.

## Comprehension

1. What user role(s) can reach the behavior in lib/screens/teacher/attendance/teacher_attendance_screen.dart?

2. Which database table or RPC would you inspect in Supabase to debug it?
3. Does it hold UI, state, or both? Why was that choice made?
4. What happens offline — cache, error, or empty?
5. Name one widget or provider that would break if this file's public API changed.

## lib/screens/teacher/dashboard/teacher_dashboard_screen.dart

Application source used by MU Study. Read the imports first, then the public types, then the widget build or provider body.

Line count: 476. Import count: 16. Read imports to learn dependencies, then scan for class / provider names, then read the first public method end-to-end.

> **How to study this file**
> 1) Name the layer (screen / provider / model / widget / service).
> 2) List the tables or RPCs it touches (search for .from( and .rpc().
> 3) List the providers it watches or invalidates.
> 4) Predict what breaks if this file is deleted.
> 5) Only then read the listing below.

## Comprehension

1. What user role(s) can reach the behavior in lib/screens/teacher/dashboard/teacher_dashboard_screen.dart?
2. Which database table or RPC would you inspect in Supabase to debug it?
3. Does it hold UI, state, or both? Why was that choice made?
4. What happens offline — cache, error, or empty?
5. Name one widget or provider that would break if this file's public API changed.

## lib/screens/teacher/homework/teacher_homework_pack_screen.dart

Application source used by MU Study. Read the imports first, then the public types, then the widget build or provider body.

Line count: 420. Import count: 13. Read imports to learn dependencies, then scan for class / provider names, then read the first public method end-to-end.

**How to study this file**
1) Name the layer (screen / provider / model / widget / service).
2) List the tables or RPCs it touches (search for .from( and .rpc().
3) List the providers it watches or invalidates.
4) Predict what breaks if this file is deleted.
5) Only then read the listing below.

## Comprehension

1. What user role(s) can reach the behavior in lib/screens/teacher/homework/teacher_homework_pack_screen.dart?
2. Which database table or RPC would you inspect in Supabase to debug it?
3. Does it hold UI, state, or both? Why was that choice made?
4. What happens offline — cache, error, or empty?
5. Name one widget or provider that would break if this file's public API changed.

## lib/screens/teacher/homework/teacher_submissions_screen.dart

Application source used by MU Study. Read the imports first, then the public types, then the widget build or provider body.

Line count: 402. Import count: 17. Read imports to learn dependencies, then scan for class / provider names, then read the first public method end-to-end.

```

## Comprehension

1. What user role(s) can reach the behavior in lib/screens/teacher/homework/teacher_submissions_screen.dart?
2. Which database table or RPC would you inspect in Supabase to debug it?
3. Does it hold UI, state, or both? Why was that choice made?
4. What happens offline — cache, error, or empty?
5. Name one widget or provider that would break if this file's public API changed.

## lib/screens/teacher/marks/teacher_marks_screen.dart

Application source used by MU Study. Read the imports first, then the public types, then the widget build or provider body.

Line count: 481. Import count: 21. Read imports to learn dependencies, then scan for class / provider names, then read the first public method end-to-end.

## Comprehension

1. What user role(s) can reach the behavior in lib/screens/teacher/marks/teacher_marks_screen.dart?
2. Which database table or RPC would you inspect in Supabase to debug it?
3. Does it hold UI, state, or both? Why was that choice made?
4. What happens offline — cache, error, or empty?
5. Name one widget or provider that would break if this file’s public API changed.

## lib/screens/teacher/marks/widgets/bulk_mark_sheet.dart

Application source used by MU Study. Read the imports first, then the public types, then the widget build or provider body.

Line count: 240. Import count: 9. Read imports to learn dependencies, then scan for class / provider names, then read the first public method end-to-end.

- import 'package:flutter/material.dart';
- import 'package:flutter/services.dart';
- import 'package:flutter_riverpod/flutter_riverpod.dart';
- import 'package:mu_study/core/theme/app_colors.dart';
- import 'package:mu_study/l10n/l10n_x.dart';
- import 'package:mu_study/models/models.dart';
- import 'package:mu_study/providers/auth/auth_provider.dart';
- import 'package:mu_study/providers/marks/marks_providers.dart';
- import 'package:mu_study/screens/teacher/marks/widgets/gradebook_helpers.dart';

**How to study this file**
1) Name the layer (screen / provider / model / widget / service).
2) List the tables or RPCs it touches (search for .from( and .rpc().
3) List the providers it watches or invalidates.
4) Predict what breaks if this file is deleted.
5) Only then read the listing below.

## Comprehension

1. What user role(s) can reach the behavior in lib/tools/generate_school_sql.dart?

2. Which database table or RPC would you inspect in Supabase to debug it?
3. Does it hold UI, state, or both? Why was that choice made?
4. What happens offline — cache, error, or empty?
5. Name one widget or provider that would break if this file's public API changed.

# Annotated source — line lessons for every Dart file

The source atlas printed raw files. This chapter slows down: every class and provider is named, and every line that talks to Supabase, Riverpod, or the router is explained in plain English. Use it when a tutorial says “open this file” and you do not know which line matters.

# Line lesson — lib/components/analytics/teacher_analytics_charts.dart

Application source used by MU Study. Read the imports first, then the public types, then the widget build or provider body.

No top-level class/provider parsed (the file may be a barrel export or use syntax the lesson parser skips). Read it as glue code.

## Why these lines exist

**L8.** `class AnalyticsChartPoint {`

Type definition. If this is a widget, find build(). If this is a repository, find the supabase calls.

**L15.** `class MarkDistributionDoughnut extends StatelessWidget {`

Type definition. If this is a widget, find build(). If this is a repository, find the supabase calls.

**L114.** `class AttendanceTrendBars extends StatelessWidget {`

Type definition. If this is a widget, find build(). If this is a repository, find the supabase calls.

**L319.** `class _WeekCategory {`

Type definition. If this is a widget, find build(). If this is a repository, find the supabase calls.

**L327.** `class _LegendPill extends StatelessWidget {`

Type definition. If this is a widget, find build(). If this is a repository, find the supabase calls.

> **TASK — Predict a break in lib/components/analytics/teacher_analytics_charts.dart**
> Name one line above. Describe the user-visible bug if you delete it. Then restore it in your mind — do not actually break a working tree unless you are on a branch.

# Line lesson — lib/components/attachments/attachment_preview.dart

Application source used by MU Study. Read the imports first, then the public types, then the widget build or provider body.

No top-level class/provider parsed (the file may be a barrel export or use syntax the lesson parser skips). Read it as glue code.

## Why these lines exist

**L83.** `class AttachmentPreview extends StatelessWidget {`

Type definition. If this is a widget, find build(). If this is a repository, find the supabase calls.

**L137.** `class _ImagePreviewCard extends StatelessWidget {`

Type definition. If this is a widget, find build(). If this is a repository, find the supabase calls.

**L320.** `class _FilePreviewCard extends StatelessWidget {`

Type definition. If this is a widget, find build(). If this is a repository, find the supabase calls.

**L424.** `class _RemoveButton extends StatelessWidget {`

Type definition. If this is a widget, find build(). If this is a repository, find the supabase calls.

**L452.** `class _ImageLightbox extends StatelessWidget {`

Type definition. If this is a widget, find build(). If this is a repository, find the supabase calls.

> **TASK — Predict a break in lib/components/attachments/attachment_preview.dart**
> Name one line above. Describe the user-visible bug if you delete it. Then restore it in your mind — do not actually break a working tree unless you are on a branch.

# Line lesson — lib/components/attachments/voice_note_field.dart

Application source used by MU Study. Read the imports first, then the public types, then the widget build or provider body.

No top-level class/provider parsed (the file may be a barrel export or use syntax the lesson parser skips). Read it as glue code.

## Why these lines exist

**L13.** `class VoiceNoteField extends StatefulWidget {`

Type definition. If this is a widget, find build(). If this is a repository, find the supabase calls.

**L31.** `class _VoiceNoteFieldState extends State<VoiceNoteField> {`

Type definition. If this is a widget, find build(). If this is a repository, find the supabase calls.

**L390.** `class VoiceNotePlayer extends StatefulWidget {`

Type definition. If this is a widget, find build(). If this is a repository, find the supabase calls.

**L400.** `class _VoiceNotePlayerState extends State<VoiceNotePlayer> {`

Type definition. If this is a widget, find build(). If this is a repository, find the supabase calls.

**L505.** `class _VoiceShell extends StatelessWidget {`

Type definition. If this is a widget, find build(). If this is a repository, find the supabase calls.

**L547.** `class _RoundAction extends StatelessWidget {`

Type definition. If this is a widget, find build(). If this is a repository, find the supabase calls.

**L576.** `class _PulsingDot extends StatefulWidget {`

Type definition. If this is a widget, find build(). If this is a repository, find the supabase calls.

**L585.** `class _PulsingDotState extends State<_PulsingDot>`

Type definition. If this is a widget, find build(). If this is a repository, find the supabase calls.

**L586.** `with SingleTickerProviderStateMixin {`

Riverpod binding. Name it after the value it exposes.

> **TASK — Predict a break in lib/components/attachments/voice_note_field.dart**
> Name one line above. Describe the user-visible bug if you delete it. Then restore it in your mind — do not actually break a working tree unless you are on a branch.

# Line lesson — lib/components/attendance/attendance_calendar_grid.dart

Application source used by MU Study. Read the imports first, then the public types, then the widget build or provider body.

No top-level class/provider parsed (the file may be a barrel export or use syntax the lesson parser skips). Read it as glue code.

## Why these lines exist

**L46.** `class AttendanceCalendarGrid extends StatelessWidget {`

Type definition. If this is a widget, find build(). If this is a repository, find the supabase calls.

**L127.** `class _DayCell extends StatelessWidget {`

Type definition. If this is a widget, find build(). If this is a repository, find the supabase calls.

**L206.** `class AttendanceMonthHeader extends StatelessWidget {`

Type definition. If this is a widget, find build(). If this is a repository, find the supabase calls.

**L248.** `class AttendanceStatsBar extends StatelessWidget {`

Type definition. If this is a widget, find build(). If this is a repository, find the supabase calls.

**L294.** `class _StatChip extends StatelessWidget {`

Type definition. If this is a widget, find build(). If this is a repository, find the supabase calls.

**L340.** `class AttendanceLegendRow extends StatelessWidget {`

Type definition. If this is a widget, find build(). If this is a repository, find the supabase calls.

**L369.** `class _Legend extends StatelessWidget {`

Type definition. If this is a widget, find build(). If this is a repository, find the supabase calls.

# Line lesson — lib/components/dialogs/pdf_viewer_sheet.dart

Application source used by MU Study. Read the imports first, then the public types, then the widget build or provider body.

No top-level class/provider parsed (the file may be a barrel export or use syntax the lesson parser skips). Read it as glue code.

## Why these lines exist

This file is mostly layout, colors, or pure functions. That is still product code: a theme token file is how Nature Paper stays consistent. Read it top to bottom once, then return when a screen imports it.

> **TASK — Predict a break in lib/components/dialogs/pdf_viewer_sheet.dart**
> Name one line above. Describe the user-visible bug if you delete it. Then restore it in your mind — do not actually break a working tree unless you are on a branch.

# Line lesson — lib/components/homework/due_date_label.dart

Application source used by MU Study. Read the imports first, then the public types, then the widget build or provider body.

No top-level class/provider parsed (the file may be a barrel export or use syntax the lesson parser skips). Read it as glue code.

## Why these lines exist

**L8.** `class DueDateLabel extends StatelessWidget {`

Type definition. If this is a widget, find build(). If this is a repository, find the supabase calls.

> **TASK — Predict a break in lib/components/homework/due_date_label.dart**
> Name one line above. Describe the user-visible bug if you delete it. Then restore it in your mind — do not actually break a working tree unless you are on a branch.

# Line lesson — lib/components/inputs/group_selector.dart

Application source used by MU Study. Read the imports first, then the public types, then the widget build or provider body.

No top-level class/provider parsed (the file may be a barrel export or use syntax the lesson parser skips). Read it as glue code.

## Why these lines exist

**L7.** `class GroupSelector extends ConsumerWidget {`

Type definition. If this is a widget, find build(). If this is a repository, find the supabase calls.

**L14.** `final groups = ref.watch(myGroupsProvider);`

Rebuild this widget/provider when the dependency changes. Do not put watch in a click handler.

**L15.** `final activeId = ref.watch(activeGroupIdProvider);`

Rebuild this widget/provider when the dependency changes. Do not put watch in a click handler.

**L57.** `ref.read(selectedGroupIdProvider.notifier).state = value;`

One-shot access, typical in onPressed. Login uses read(authRepositoryProvider).

# Line lesson — lib/components/layouts/app_shell.dart

Application source used by MU Study. Read the imports first, then the public types, then the widget build or provider body.

No top-level class/provider parsed (the file may be a barrel export or use syntax the lesson parser skips). Read it as glue code.

## Why these lines exist

**L20.** `class AppShell extends ConsumerStatefulWidget {`

Type definition. If this is a widget, find build(). If this is a repository, find the supabase calls.

**L33.** `ConsumerState<AppShell> createState() => _AppShellState();`

Widget that can watch providers. Required for profile/theme/locale.

**L36.** `class _AppShellState extends ConsumerState<AppShell> {`

Type definition. If this is a widget, find build(). If this is a repository, find the supabase calls.

**L47.** `context.go(widget.destinations[index].path);`

Replace the navigation stack location. Login uses /boot so redirect can settle.

**L54.** `final unreadNotifications = ref.watch(unreadNotificationsCountProvider);`

Rebuild this widget/provider when the dependency changes. Do not put watch in a click handler.

**L55.** `final unreadChat = ref.watch(focusChatMutedProvider)`

Rebuild this widget/provider when the dependency changes. Do not put watch in a click handler.

**L57.** `: ref.watch(unreadChatCountProvider);`

Rebuild this widget/provider when the dependency changes. Do not put watch in a click handler.

> **TASK — Predict a break in lib/components/layouts/app_shell.dart**
> Name one line above. Describe the user-visible bug if you delete it. Then restore it in your mind — do not actually break a working tree unless you are on a branch.

# Line lesson — lib/components/layouts/empty_state.dart

Application source used by MU Study. Read the imports first, then the public types, then the widget build or provider body.

No top-level class/provider parsed (the file may be a barrel export or use syntax the lesson parser skips). Read it as glue code.

## Why these lines exist

**L7.** `class EmptyState extends StatelessWidget {`

Type definition. If this is a widget, find build(). If this is a repository, find the supabase calls.

**L85.** `class ErrorState extends StatelessWidget {`

Type definition. If this is a widget, find build(). If this is a repository, find the supabase calls.

> **TASK — Predict a break in lib/components/layouts/empty_state.dart**
> Name one line above. Describe the user-visible bug if you delete it. Then restore it in your mind — do not actually break a working tree unless you are on a branch.

# Line lesson — lib/components/layouts/premium_section_header.dart

Application source used by MU Study. Read the imports first, then the public types, then the widget build or provider body.

No top-level class/provider parsed (the file may be a barrel export or use syntax the lesson parser skips). Read it as glue code.

## Why these lines exist

**L6.** `class PremiumSectionHeader extends StatelessWidget {`

Type definition. If this is a widget, find build(). If this is a repository, find the supabase calls.

> **TASK — Predict a break in lib/components/layouts/premium_section_header.dart**
> Name one line above. Describe the user-visible bug if you delete it. Then restore it in your mind — do not actually break a working tree unless you are on a branch.

# Line lesson — lib/components/layouts/shell_nav_bar.dart

Application source used by MU Study. Read the imports first, then the public types, then the widget build or provider body.

No top-level class/provider parsed (the file may be a barrel export or use syntax the lesson parser skips). Read it as glue code.

## Why these lines exist

**L32.** `enum ShellBadgeKind { none, notifications, chat }`

Closed set of values. Keep it aligned with the Postgres enum or the fromString helper.

**L34.** `class ShellDestination {`

Type definition. If this is a widget, find build(). If this is a repository, find the supabase calls.

**L84.** `class ShellFabLocation extends StandardFabLocation with FabEndOffsetX {`

Type definition. If this is a widget, find build(). If this is a repository, find the supabase calls.

**L134.** `class ShellNavBar extends StatelessWidget {`

Type definition. If this is a widget, find build(). If this is a repository, find the supabase calls.

**L268.** `class _ShellNavItem extends StatelessWidget {`

Type definition. If this is a widget, find build(). If this is a repository, find the supabase calls.

> **TASK — Predict a break in lib/components/layouts/shell_nav_bar.dart**
> Name one line above. Describe the user-visible bug if you delete it. Then restore it in your mind — do not actually break a working tree unless you are on a branch.

# Line lesson — lib/components/marks/mark_average_card.dart

Application source used by MU Study. Read the imports first, then the public types, then the widget build or provider body.

No top-level class/provider parsed (the file may be a barrel export or use syntax the lesson parser skips). Read it as glue code.

## Why these lines exist

**L8.** `class MarkAverageCard extends StatelessWidget {`

Type definition. If this is a widget, find build(). If this is a repository, find the supabase calls.

> **TASK — Predict a break in lib/components/marks/mark_average_card.dart**
> Name one line above. Describe the user-visible bug if you delete it. Then restore it in your mind — do not actually break a working tree unless you are on a branch.

# Line lesson — lib/components/marks/percent_badge.dart

Application source used by MU Study. Read the imports first, then the public types, then the widget build or provider body.

No top-level class/provider parsed (the file may be a barrel export or use syntax the lesson parser skips). Read it as glue code.

## Why these lines exist

**L47.** `class PercentBadge extends StatelessWidget {`

Type definition. If this is a widget, find build(). If this is a repository, find the supabase calls.

> **TASK — Predict a break in lib/components/marks/percent_badge.dart**
> Name one line above. Describe the user-visible bug if you delete it. Then restore it in your mind — do not actually break a working tree unless you are on a branch.

# Line lesson — lib/components/marks/term_selector.dart

Application source used by MU Study. Read the imports first, then the public types, then the widget build or provider body.

No top-level class/provider parsed (the file may be a barrel export or use syntax the lesson parser skips). Read it as glue code.

## Why these lines exist

**L8.** `class TermSelector extends ConsumerWidget {`

Type definition. If this is a widget, find build(). If this is a repository, find the supabase calls.

**L15.** `final current = ref.watch(selectedMarkTermProvider);`

Rebuild this widget/provider when the dependency changes. Do not put watch in a click handler.

**L16.** `final optionsAsync = ref.watch(academicTermOptionsProvider);`

Rebuild this widget/provider when the dependency changes. Do not put watch in a click handler.

**L82.** `.read(selectedMarkTermProvider.notifier)`

Riverpod binding. Name it after the value it exposes.

**L83.** `.select(next);`

Read columns. Narrow the select when the row is wide; '*' is acceptable for small domain rows.

> **TASK — Predict a break in lib/components/marks/term_selector.dart**
> Name one line above. Describe the user-visible bug if you delete it. Then restore it in your mind — do not actually break a working tree unless you are on a branch.

# Line lesson — lib/components/settings/language_settings_tile.dart

Application source used by MU Study. Read the imports first, then the public types, then the widget build or provider body.

No top-level class/provider parsed (the file may be a barrel export or use syntax the lesson parser skips). Read it as glue code.

## Why these lines exist

**L9.** `class LanguageSettingsTile extends ConsumerWidget {`

Type definition. If this is a widget, find build(). If this is a repository, find the supabase calls.

**L29.** `final current = AppLanguage.fromLocale(ref.watch(localeProvider));`

Rebuild this widget/provider when the dependency changes. Do not put watch in a click handler.

**L129.** `ref.read(localeProvider.notifier).setLanguage(lang);`

One-shot access, typical in onPressed. Login uses read(authRepositoryProvider).

> **TASK — Predict a break in lib/components/settings/language_settings_tile.dart**
> Name one line above. Describe the user-visible bug if you delete it. Then restore it in your mind — do not actually break a working tree unless you are on a branch.

# Line lesson — lib/core/admin/credential_slip.dart

Credential slip PDF generation for printed login cards. This file (credential slip) is one concrete piece of that layer.

No top-level class/provider parsed (the file may be a barrel export or use syntax the lesson parser skips). Read it as glue code.

## Why these lines exist

**L1.** `class CredentialSlip {`

Type definition. If this is a widget, find build(). If this is a repository, find the supabase calls.

> **TASK — Predict a break in lib/core/admin/credential_slip.dart**
> Name one line above. Describe the user-visible bug if you delete it. Then restore it in your mind — do not actually break a working tree unless you are on a branch.

# Line lesson — lib/core/admin/credential_slips_pdf.dart

Credential slip PDF generation for printed login cards. This file (credential slips pdf) is one concrete piece of that layer.

No top-level class/provider parsed (the file may be a barrel export or use syntax the lesson parser skips). Read it as glue code.

## Why these lines exist

This file is mostly layout, colors, or pure functions. That is still product code: a theme token file is how Nature Paper stays consistent. Read it top to bottom once, then return when a screen imports it.

> **TASK — Predict a break in lib/core/admin/credential_slips_pdf.dart**
> Name one line above. Describe the user-visible bug if you delete it. Then restore it in your mind — do not actually break a working tree unless you are on a branch.

# Line lesson — lib/core/admin/credential_slips_source.dart

Credential slip PDF generation for printed login cards. This file (credential slips source) is one concrete piece of that layer.

No top-level class/provider parsed (the file may be a barrel export or use syntax the lesson parser skips). Read it as glue code.

## Why these lines exist

**L18.** `await supabase.rpc(`

Remote procedure call. Authorization and writes that are too complex for a single RLS policy often live here (login email, admin create user, unread counts).

**L36.** `.from('profiles')`

PostgREST table access. RLS still applies. The string is the Postgres table or view name.

**L37.** `.select('id')`

Read columns. Narrow the select when the row is wide; '*' is acceptable for small domain rows.

**L38.** `.eq('username', username)`

Equality filter. This is the WHERE clause. Wrong UUID type (profile vs student id) yields empty lists.

**L61.** `final rows = await supabase.rpc(`

Remote procedure call. Authorization and writes that are too complex for a single RLS policy often live here (login email, admin create user, unread counts).

**L71.** `final row = Map<String, dynamic>.from(raw as Map);`

PostgREST table access. RLS still applies. The string is the Postgres table or view name.

**L93.** `.from('group_students')`

PostgREST table access. RLS still applies. The string is the Postgres table or view name.

**L94.** `.select(`

Read columns. Narrow the select when the row is wide; '*' is acceptable for small domain rows.

**L97.** `.eq('group_id', groupId);`

Equality filter. This is the WHERE clause. Wrong UUID type (profile vs student id) yields empty lists.

**L108.** `.from('profiles')`

PostgREST table access. RLS still applies. The string is the Postgres table or view name.

**L109.** `.select('id, username, full_name, role, is_disabled')`

Read columns. Narrow the select when the row is wide; '*' is acceptable for small domain rows.

**L110.** `.eq('role', role.name)`

Equality filter. This is the WHERE clause. Wrong UUID type (profile vs student id) yields empty lists.

**L111.** `.eq('is_disabled', false)`

Equality filter. This is the WHERE clause. Wrong UUID type (profile vs student id) yields empty lists.

**L166.** `await supabase.rpc(`

Remote procedure call. Authorization and writes that are too complex for a single RLS policy often live here (login email, admin create user, unread counts).

**TASK — Predict a break in lib/core/admin/credential_slips_source.dart**
Name one line above. Describe the user-visible bug if you delete it. Then restore it in your mind — do not actually break a working tree unless you are on a branch.

# Line lesson — lib/core/chat/animated_emoji_registry.dart

Emoji helpers and animated emoji registry. This file (animated emoji registry) is one concrete piece of that layer.

No top-level class/provider parsed (the file may be a barrel export or use syntax the lesson parser skips). Read it as glue code.

## Why these lines exist

This file is mostly layout, colors, or pure functions. That is still product code: a theme token file is how Nature Paper stays consistent. Read it top to bottom once, then return when a screen imports it.

> **TASK — Predict a break in lib/core/chat/animated_emoji_registry.dart**
> Name one line above. Describe the user-visible bug if you delete it. Then restore it in your mind — do not actually break a working tree unless you are on a branch.

# Line lesson — lib/core/chat/emoji_message.dart

Emoji helpers and animated emoji registry. This file (emoji message) is one concrete piece of that layer.

No top-level class/provider parsed (the file may be a barrel export or use syntax the lesson parser skips). Read it as glue code.

## Why these lines exist

This file is mostly layout, colors, or pure functions. That is still product code: a theme token file is how Nature Paper stays consistent. Read it top to bottom once, then return when a screen imports it.

> Name one line above. Describe the user-visible bug if you delete it. Then restore it in your mind — do not actually break a working tree unless you are on a branch.

# Line lesson — lib/core/constants/env.dart

Compile-time and runtime configuration (Env). This file (env) is one concrete piece of that layer.

No top-level class/provider parsed (the file may be a barrel export or use syntax the lesson parser skips). Read it as glue code.

## Why these lines exist

**L3.** `class Env {`

Type definition. If this is a widget, find build(). If this is a repository, find the supabase calls.

> **TASK — Predict a break in lib/core/constants/env.dart**
> Name one line above. Describe the user-visible bug if you delete it. Then restore it in your mind — do not actually break a working tree unless you are on a branch.

# Line lesson — lib/core/focus/focus_time_up_cue.dart

Focus-mode audio/visual cues (local, not a database table). This file (focus time up cue) is one concrete piece of that layer.

No top-level class/provider parsed (the file may be a barrel export or use syntax the lesson parser skips). Read it as glue code.

## Why these lines exist

This file is mostly layout, colors, or pure functions. That is still product code: a theme token file is how Nature Paper stays consistent. Read it top to bottom once, then return when a screen imports it.

> **TASK — Predict a break in lib/core/focus/focus_time_up_cue.dart**
> Name one line above. Describe the user-visible bug if you delete it. Then restore it in your mind — do not actually break a working tree unless you are on a branch.

# Line lesson — lib/core/homework/assignment_due.dart

Due-date helpers and assignment template JSON. This file (assignment due) is one concrete piece of that layer.

No top-level class/provider parsed (the file may be a barrel export or use syntax the lesson parser skips). Read it as glue code.

## Why these lines exist

**L3.** `enum AssignmentDueStatus { none, upcoming, dueSoon, dueToday, overdue }`

Closed set of values. Keep it aligned with the Postgres enum or the fromString helper.

> **TASK — Predict a break in lib/core/homework/assignment_due.dart**
> Name one line above. Describe the user-visible bug if you delete it. Then restore it in your mind — do not actually break a working tree unless you are on a branch.

# Line lesson — lib/core/homework/assignment_templates.dart

Due-date helpers and assignment template JSON. This file (assignment templates) is one concrete piece of that layer.

No top-level class/provider parsed (the file may be a barrel export or use syntax the lesson parser skips). Read it as glue code.

## Why these lines exist

**L4.** `class TemplateTaskDraft {`

Type definition. If this is a widget, find build(). If this is a repository, find the supabase calls.

**L48.** `class AssignmentTemplate {`

Type definition. If this is a widget, find build(). If this is a repository, find the supabase calls.

**L76.** `TemplateTaskDraft.fromJson(Map<String, dynamic>.from(item)),`

PostgREST table access. RLS still applies. The string is the Postgres table or view name.

**L102.** `.from('assignment_templates')`

PostgREST table access. RLS still applies. The string is the Postgres table or view name.

**L103.** `.select()`

Read columns. Narrow the select when the row is wide; '*' is acceptable for small domain rows.

**L104.** `.eq('teacher_id', teacherId)`

Equality filter. This is the WHERE clause. Wrong UUID type (profile vs student id) yields empty lists.

**L107.** `.map((e) => AssignmentTemplate.fromJson(Map<String, dynamic>.from(e)))`

PostgREST table access. RLS still applies. The string is the Postgres table or view name.

**L116.** `.from('tasks')`

PostgREST table access. RLS still applies. The string is the Postgres table or view name.

**L117.** `.select()`

Read columns. Narrow the select when the row is wide; '*' is acceptable for small domain rows.

**L118.** `.eq('assignment_id', assignment.id)`

Equality filter. This is the WHERE clause. Wrong UUID type (profile vs student id) yields empty lists.

**L123.** `TaskItem.fromJson(Map<String, dynamic>.from(e)),`

PostgREST table access. RLS still applies. The string is the Postgres table or view name.

**L149.** `.from('assignment_templates')`

PostgREST table access. RLS still applies. The string is the Postgres table or view name.

**L150.** `.insert({`

Creates a row. Failures are usually unique violations or WITH CHECK policy failures.

**L158.** `.select()`

Read columns. Narrow the select when the row is wide; '*' is acceptable for small domain rows.

**L161.** `return AssignmentTemplate.fromJson(Map<String, dynamic>.from(row));`

PostgREST table access. RLS still applies. The string is the Postgres table or view name.

**L165.** `await supabase.from('assignment_templates').delete().eq('id', templateId);`

PostgREST table access. RLS still applies. The string is the Postgres table or view name.

**L177.** `.from('assignments')`

PostgREST table access. RLS still applies. The string is the Postgres table or view name.

**L178.** `.insert({`

Creates a row. Failures are usually unique violations or WITH CHECK policy failures.

**L188.** `.select()`

Read columns. Narrow the select when the row is wide; '*' is acceptable for small domain rows.

**L191.** `final assignment = Assignment.fromJson(Map<String, dynamic>.from(inserted));`

PostgREST table access. RLS still applies. The string is the Postgres table or view name.

**L211.** `await supabase.from('tasks').insert([`

PostgREST table access. RLS still applies. The string is the Postgres table or view name.

**L235.** `.from('tasks')`

PostgREST table access. RLS still applies. The string is the Postgres table or view name.

**L236.** `.select()`

Read columns. Narrow the select when the row is wide; '*' is acceptable for small domain rows.

**L237.** `.eq('assignment_id', source.id)`

Equality filter. This is the WHERE clause. Wrong UUID type (profile vs student id) yields empty lists.

**L245.** `.from('assignments')`

PostgREST table access. RLS still applies. The string is the Postgres table or view name.

**L246.** `.insert({`

Creates a row. Failures are usually unique violations or WITH CHECK policy failures.

**L254.** `.select()`

Read columns. Narrow the select when the row is wide; '*' is acceptable for small domain rows.

**L257.** `final assignment = Assignment.fromJson(Map<String, dynamic>.from(inserted));`

PostgREST table access. RLS still applies. The string is the Postgres table or view name.

**L261.** `await supabase.from('tasks').insert({`

PostgREST table access. RLS still applies. The string is the Postgres table or view name.

**L268.** `final t = TaskItem.fromJson(Map<String, dynamic>.from(taskRows.first));`

PostgREST table access. RLS still applies. The string is the Postgres table or view name.

**L269.** `await supabase.from('tasks').insert({`

PostgREST table access. RLS still applies. The string is the Postgres table or view name.

**L281.** `TaskItem.fromJson(Map<String, dynamic>.from(row)),`

PostgREST table access. RLS still applies. The string is the Postgres table or view name.

**L283.** `await supabase.from('tasks').insert([`

PostgREST table access. RLS still applies. The string is the Postgres table or view name.

**TASK — Predict a break in lib/core/homework/assignment_templates.dart**
Name one line above. Describe the user-visible bug if you delete it. Then restore it in your mind — do not actually break a working tree unless you are on a branch.

# Line lesson — lib/core/homework/feedback_reuse.dart

Due-date helpers and assignment template JSON. This file (feedback reuse) is one concrete piece of that layer.

No top-level class/provider parsed (the file may be a barrel export or use syntax the lesson parser skips). Read it as glue code.

## Why these lines exist

**L41.** `.from('submissions')`

PostgREST table access. RLS still applies. The string is the Postgres table or view name.

**L42.** `.select('task_id')`

Read columns. Narrow the select when the row is wide; '*' is acceptable for small domain rows.

**L43.** `.eq('id', submissionId)`

Equality filter. This is the WHERE clause. Wrong UUID type (profile vs student id) yields empty lists.

**L49.** `.from('submissions')`

PostgREST table access. RLS still applies. The string is the Postgres table or view name.

**L50.** `.select('id')`

Read columns. Narrow the select when the row is wide; '*' is acceptable for small domain rows.

**L51.** `.eq('task_id', taskId)`

Equality filter. This is the WHERE clause. Wrong UUID type (profile vs student id) yields empty lists.

**L59.** `.from('submissions')`

PostgREST table access. RLS still applies. The string is the Postgres table or view name.

**L60.** `.update({'feedback': text})`

Mutates matching rows. Silent zero rows usually means SELECT policy is missing for UPDATE.

**L67.** `.from('assignments')`

PostgREST table access. RLS still applies. The string is the Postgres table or view name.

**L68.** `.select('id')`

Read columns. Narrow the select when the row is wide; '*' is acceptable for small domain rows.

**L69.** `.eq('teacher_id', teacherId);`

Equality filter. This is the WHERE clause. Wrong UUID type (profile vs student id) yields empty lists.

**L74.** `.from('tasks')`

PostgREST table access. RLS still applies. The string is the Postgres table or view name.

**L75.** `.select('id')`

Read columns. Narrow the select when the row is wide; '*' is acceptable for small domain rows.

**L81.** `.from('submissions')`

PostgREST table access. RLS still applies. The string is the Postgres table or view name.

**L82.** `.select('feedback')`

Read columns. Narrow the select when the row is wide; '*' is acceptable for small domain rows.

**TASK — Predict a break in lib/core/homework/feedback_reuse.dart**
Name one line above. Describe the user-visible bug if you delete it. Then restore it in your mind — do not actually break a working tree unless you are on a branch.

# Line lesson — lib/core/locale/app_locale.dart

Supported locales EN/RU/UZ. This file (app locale) is one concrete piece of that layer.

No top-level class/provider parsed (the file may be a barrel export or use syntax the lesson parser skips). Read it as glue code.

## Why these lines exist

**L3.** `enum AppLanguage {`

Closed set of values. Keep it aligned with the Postgres enum or the fromString helper.

> **TASK — Predict a break in lib/core/locale/app_locale.dart**
> Name one line above. Describe the user-visible bug if you delete it. Then restore it in your mind — do not actually break a working tree unless you are on a branch.

# Line lesson — lib/core/marks/academic_term.dart

Academic term math and CSV export. This file (academic term) is one concrete piece of that layer.

No top-level class/provider parsed (the file may be a barrel export or use syntax the lesson parser skips). Read it as glue code.

## Why these lines exist

**L5.** `class AcademicTerm {`

Type definition. If this is a widget, find build(). If this is a repository, find the supabase calls.

**L150.** `class AcademicYearRecord {`

Type definition. If this is a widget, find build(). If this is a repository, find the supabase calls.

**L201.** `.from('academic_years')`

PostgREST table access. RLS still applies. The string is the Postgres table or view name.

**L202.** `.select('id, start_year, label, is_current, created_at')`

Read columns. Narrow the select when the row is wide; '*' is acceptable for small domain rows.

**L209.** `.from('academic_terms')`

PostgREST table access. RLS still applies. The string is the Postgres table or view name.

**L210.** `.select('id, academic_year_id, semester, starts_on, ends_on')`

Read columns. Narrow the select when the row is wide; '*' is acceptable for small domain rows.

**L226.** `final academicTermOptionsProvider = FutureProvider<List<AcademicTerm>>((`

Riverpod binding. Name it after the value it exposes.

**L233.** `final academicYearsProvider = FutureProvider<List<AcademicYearRecord>>((`

Riverpod binding. Name it after the value it exposes.

**L239.** `class SelectedMarkTermNotifier extends Notifier<AcademicTerm> {`

Type definition. If this is a widget, find build(). If this is a repository, find the supabase calls.

**L244.** `ref.listen(academicTermOptionsProvider, (prev, next) {`

Riverpod binding. Name it after the value it exposes.

**L275.** `final selectedMarkTermProvider =`

Riverpod binding. Name it after the value it exposes.

**L276.** `NotifierProvider<SelectedMarkTermNotifier, AcademicTerm>(`

Riverpod binding. Name it after the value it exposes.

**L277.** `SelectedMarkTermNotifier.new,`

Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

> **TASK — Predict a break in lib/core/marks/academic_term.dart**
> Name one line above. Describe the user-visible bug if you delete it. Then restore it in your mind — do not actually break a working tree unless you are on a branch.

# Line lesson — lib/core/marks/marks_csv_export.dart

Academic term math and CSV export. This file (marks csv export) is one concrete piece of that layer.

No top-level class/provider parsed (the file may be a barrel export or use syntax the lesson parser skips). Read it as glue code.

## Why these lines exist

**L26.** `.from('marks')`

PostgREST table access. RLS still applies. The string is the Postgres table or view name.

**L27.** `.select('*, students(profiles(full_name, username))')`

Read columns. Narrow the select when the row is wide; '*' is acceptable for small domain rows.

**L28.** `.eq('group_id', groupId);`

Equality filter. This is the WHERE clause. Wrong UUID type (profile vs student id) yields empty lists.

**L54.** `final mark = Mark.fromJson(Map<String, dynamic>.from(row));`

PostgREST table access. RLS still applies. The string is the Postgres table or view name.

> **TASK — Predict a break in lib/core/marks/marks_csv_export.dart**

# Line lesson — lib/core/paging/page_result.dart

Generic page-result type for list pagination. This file (page result) is one concrete piece of that layer.

No top-level class/provider parsed (the file may be a barrel export or use syntax the lesson parser skips). Read it as glue code.

## Why these lines exist

**L1.** `class PageResult<T> {`

Type definition. If this is a widget, find build(). If this is a repository, find the supabase calls.

> **TASK — Predict a break in lib/core/paging/page_result.dart**
> Name one line above. Describe the user-visible bug if you delete it. Then restore it in your mind — do not actually break a working tree unless you are on a branch.

# Line lesson — lib/core/progress/progress_report.dart

Student progress report model + PDF + share. This file (progress report) is one concrete piece of that layer.

No top-level class/provider parsed (the file may be a barrel export or use syntax the lesson parser skips). Read it as glue code.

## Why these lines exist

**L8.** `class ProgressReport {`

Type definition. If this is a widget, find build(). If this is a repository, find the supabase calls.

**L45.** `.from('marks')`

PostgREST table access. RLS still applies. The string is the Postgres table or view name.

**L46.** `.select()`

Read columns. Narrow the select when the row is wide; '*' is acceptable for small domain rows.

**L47.** `.eq('student_id', studentId)`

Equality filter. This is the WHERE clause. Wrong UUID type (profile vs student id) yields empty lists.

**L48.** `.eq('group_id', groupId);`

Equality filter. This is the WHERE clause. Wrong UUID type (profile vs student id) yields empty lists.

**L58.** `.map((e) => Mark.fromJson(Map<String, dynamic>.from(e)))`

PostgREST table access. RLS still applies. The string is the Postgres table or view name.

**L97.** `.from('attendance')`

PostgREST table access. RLS still applies. The string is the Postgres table or view name.

**L98.** `.select()`

Read columns. Narrow the select when the row is wide; '*' is acceptable for small domain rows.

**L99.** `.eq('group_id', groupId)`

Equality filter. This is the WHERE clause. Wrong UUID type (profile vs student id) yields empty lists.

**L100.** `.eq('student_id', studentId)`

Equality filter. This is the WHERE clause. Wrong UUID type (profile vs student id) yields empty lists.

**L107.** `(e) => AttendanceRecord.fromJson(Map<String, dynamic>.from(e)),`

PostgREST table access. RLS still applies. The string is the Postgres table or view name.

> **TASK — Predict a break in lib/core/progress/progress_report.dart**
> Name one line above. Describe the user-visible bug if you delete it. Then restore it in your mind — do not actually break a working tree unless you are on a branch.

# Line lesson — lib/core/progress/progress_report_pdf.dart

Student progress report model + PDF + share. This file (progress report pdf) is one concrete piece of that layer.

No top-level class/provider parsed (the file may be a barrel export or use syntax the lesson parser skips). Read it as glue code.

## Why these lines exist

This file is mostly layout, colors, or pure functions. That is still product code: a theme token file is how Nature Paper stays consistent. Read it top to bottom once, then return when a screen imports it.

> **TASK — Predict a break in lib/core/progress/progress_report_pdf.dart**
> Name one line above. Describe the user-visible bug if you delete it. Then restore it in your mind — do not actually break a working tree unless you are on a branch.

# Line lesson — lib/core/progress/progress_report_share.dart

Student progress report model + PDF + share. This file (progress report share) is one concrete piece of that layer.

No top-level class/provider parsed (the file may be a barrel export or use syntax the lesson parser skips). Read it as glue code.

## Why these lines exist

This file is mostly layout, colors, or pure functions. That is still product code: a theme token file is how Nature Paper stays consistent. Read it top to bottom once, then return when a screen imports it.

> **TASK — Predict a break in lib/core/progress/progress_report_share.dart**
> Name one line above. Describe the user-visible bug if you delete it. Then restore it in your mind — do not actually break a working tree unless you are on a branch.

# Line lesson — lib/core/router/app_router.dart

go_router route table and auth/language/disabled redirects. This file (app router) is one concrete piece of that layer.

No top-level class/provider parsed (the file may be a barrel export or use syntax the lesson parser skips). Read it as glue code.

## Why these lines exist

**L43.** `final routerProvider = Provider<GoRouter>((ref) {`

Riverpod binding. Name it after the value it exposes.

**L44.** `final notifier = _RouterNotifier(ref);`

Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L48.** `refreshListenable: notifier,`

Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L49.** `redirect: notifier.redirect,`

Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L74.** `class _RouterNotifier extends ChangeNotifier {`

Type definition. If this is a widget, find build(). If this is a repository, find the supabase calls.

**L75.** `_RouterNotifier(this._ref) {`

Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L76.** `_ref.listen(authStateProvider, (_, _) => notifyListeners());`

Riverpod binding. Name it after the value it exposes.

**L77.** `_ref.listen(currentProfileProvider, (_, _) => notifyListeners());`

Riverpod binding. Name it after the value it exposes.

**L91.** `final profileAsync = _ref.read(currentProfileProvider);`

One-shot access, typical in onPressed. Login uses read(authRepositoryProvider).

> **TASK — Predict a break in lib/core/router/app_router.dart**
> Name one line above. Describe the user-visible bug if you delete it. Then restore it in your mind — do not actually break a working tree unless you are on a branch.

# Line lesson — lib/core/services/app_cache.dart

Caches, voice, chat media, SharedPreferences wrappers. This file (app cache) is one concrete piece of that layer.

No top-level class/provider parsed (the file may be a barrel export or use syntax the lesson parser skips). Read it as glue code.

## Why these lines exist

This file is mostly layout, colors, or pure functions. That is still product code: a theme token file is how Nature Paper stays consistent. Read it top to bottom once, then return when a screen imports it.

> **TASK — Predict a break in lib/core/services/app_cache.dart**
> Name one line above. Describe the user-visible bug if you delete it. Then restore it in your mind — do not actually break a working tree unless you are on a branch.

# Line lesson — lib/core/services/cache_service.dart

Caches, voice, chat media, SharedPreferences wrappers. This file (cache service) is one concrete piece of that layer.

No top-level class/provider parsed (the file may be a barrel export or use syntax the lesson parser skips). Read it as glue code.

## Why these lines exist

**L6.** `class CacheService {`

Type definition. If this is a widget, find build(). If this is a repository, find the supabase calls.

**L38.** `.map((e) => Map<String, dynamic>.from(e as Map))`

PostgREST table access. RLS still applies. The string is the Postgres table or view name.

**L95.** `final cacheServiceProvider = FutureProvider<CacheService>((ref) async {`

Riverpod binding. Name it after the value it exposes.

> **TASK — Predict a break in lib/core/services/cache_service.dart**
> Name one line above. Describe the user-visible bug if you delete it. Then restore it in your mind — do not actually break a working tree unless you are on a branch.

# Line lesson — lib/core/services/chat_media_cache_service.dart

Caches, voice, chat media, SharedPreferences wrappers. This file (chat media cache service) is one concrete piece of that layer.

No top-level class/provider parsed (the file may be a barrel export or use syntax the lesson parser skips). Read it as glue code.

## Why these lines exist

**L10.** `class ChatMediaCacheService {`

Type definition. If this is a widget, find build(). If this is a repository, find the supabase calls.

**L81.** `Map<String, dynamic>.from(e.value as Map),`

PostgREST table access. RLS still applies. The string is the Postgres table or view name.

**L125.** `if (await old.exists()) await old.delete();`

Removes matching rows. CASCADE on FKs may delete children — know the blast radius.

**L177.** `await file.delete();`

Removes matching rows. CASCADE on FKs may delete children — know the blast radius.

**L194.** `await _dir!.delete(recursive: true);`

Removes matching rows. CASCADE on FKs may delete children — know the blast radius.

**L204.** `class _MediaCacheEntry {`

Type definition. If this is a widget, find build(). If this is a repository, find the supabase calls.

> **TASK — Predict a break in lib/core/services/chat_media_cache_service.dart**
> Name one line above. Describe the user-visible bug if you delete it. Then restore it in your mind — do not actually break a working tree unless you are on a branch.

# Line lesson — lib/core/services/chat_video_thumbnail_service.dart

Caches, voice, chat media, SharedPreferences wrappers. This file (chat video thumbnail service) is one concrete piece of that layer.

No top-level class/provider parsed (the file may be a barrel export or use syntax the lesson parser skips). Read it as glue code.

## Why these lines exist

**L12.** `class ChatVideoThumbnailService {`

Type definition. If this is a widget, find build(). If this is a repository, find the supabase calls.

**L111.** `await _dir!.delete(recursive: true);`

Removes matching rows. CASCADE on FKs may delete children — know the blast radius.

> **TASK — Predict a break in lib/core/services/chat_video_thumbnail_service.dart**
> Name one line above. Describe the user-visible bug if you delete it. Then restore it in your mind — do not actually break a working tree unless you are on a branch.

# Line lesson — lib/core/services/voice_cache_service.dart

Caches, voice, chat media, SharedPreferences wrappers. This file (voice cache service) is one concrete piece of that layer.

No top-level class/provider parsed (the file may be a barrel export or use syntax the lesson parser skips). Read it as glue code.

## Why these lines exist

**L9.** `class VoiceCacheService {`

Type definition. If this is a widget, find build(). If this is a repository, find the supabase calls.

**L69.** `Map<String, dynamic>.from(e.value as Map),`

PostgREST table access. RLS still applies. The string is the Postgres table or view name.

**L125.** `if (await old.exists()) await old.delete();`

Removes matching rows. CASCADE on FKs may delete children — know the blast radius.

**L153.** `await file.delete();`

Removes matching rows. CASCADE on FKs may delete children — know the blast radius.

**L176.** `await _dir!.delete(recursive: true);`

Removes matching rows. CASCADE on FKs may delete children — know the blast radius.

**L185.** `class _VoiceCacheEntry {`

Type definition. If this is a widget, find build(). If this is a repository, find the supabase calls.

> **TASK — Predict a break in lib/core/services/voice_cache_service.dart**
> Name one line above. Describe the user-visible bug if you delete it. Then restore it in your mind — do not actually break a working tree unless you are on a branch.

# Line lesson — lib/core/theme/app_colors.dart

Four visual styles × light/dark Material 3 themes. This file (app colors) is one concrete piece of that layer.

No top-level class/provider parsed (the file may be a barrel export or use syntax the lesson parser skips). Read it as glue code.

## Why these lines exist

**L5.** `class AppColors {`

Type definition. If this is a widget, find build(). If this is a repository, find the supabase calls.

> **TASK — Predict a break in lib/core/theme/app_colors.dart**
> Name one line above. Describe the user-visible bug if you delete it. Then restore it in your mind — do not actually break a working tree unless you are on a branch.

# Line lesson — lib/core/theme/app_style.dart

Four visual styles × light/dark Material 3 themes. This file (app style) is one concrete piece of that layer.

No top-level class/provider parsed (the file may be a barrel export or use syntax the lesson parser skips). Read it as glue code.

## Why these lines exist

**L1.** `enum AppStyle {`

Closed set of values. Keep it aligned with the Postgres enum or the fromString helper.

> **TASK — Predict a break in lib/core/theme/app_style.dart**
> Name one line above. Describe the user-visible bug if you delete it. Then restore it in your mind — do not actually break a working tree unless you are on a branch.

# Line lesson — lib/core/theme/app_style_tokens.dart

Four visual styles × light/dark Material 3 themes. This file (app style tokens) is one concrete piece of that layer.

No top-level class/provider parsed (the file may be a barrel export or use syntax the lesson parser skips). Read it as glue code.

## Why these lines exist

**L8.** `class AppStyleTokens extends ThemeExtension<AppStyleTokens> {`

Type definition. If this is a widget, find build(). If this is a repository, find the supabase calls.

> **TASK — Predict a break in lib/core/theme/app_style_tokens.dart**
> Name one line above. Describe the user-visible bug if you delete it. Then restore it in your mind — do not actually break a working tree unless you are on a branch.

# Line lesson — lib/core/theme/app_text_theme.dart

Four visual styles × light/dark Material 3 themes. This file (app text theme) is one concrete piece of that layer.

No top-level class/provider parsed (the file may be a barrel export or use syntax the lesson parser skips). Read it as glue code.

## Why these lines exist

This file is mostly layout, colors, or pure functions. That is still product code: a theme token file is how Nature Paper stays consistent. Read it top to bottom once, then return when a screen imports it.

> **TASK — Predict a break in lib/core/theme/app_text_theme.dart**
> Name one line above. Describe the user-visible bug if you delete it. Then restore it in your mind — do not actually break a working tree unless you are on a branch.

# Line lesson — lib/core/theme/app_theme.dart

Four visual styles × light/dark Material 3 themes. This file (app theme) is one concrete piece of that layer.

No top-level class/provider parsed (the file may be a barrel export or use syntax the lesson parser skips). Read it as glue code.

## Why these lines exist

**L10.** `class AppTheme {`

Type definition. If this is a widget, find build(). If this is a repository, find the supabase calls.

> **TASK — Predict a break in lib/core/theme/app_theme.dart**
> Name one line above. Describe the user-visible bug if you delete it. Then restore it in your mind — do not actually break a working tree unless you are on a branch.

# Line lesson — lib/core/theme/monochrome_workspace_colors.dart

Four visual styles × light/dark Material 3 themes. This file (monochrome workspace colors) is one concrete piece of that layer.

No top-level class/provider parsed (the file may be a barrel export or use syntax the lesson parser skips). Read it as glue code.

## Why these lines exist

**L3.** `class MonochromeWorkspaceColors {`

Type definition. If this is a widget, find build(). If this is a repository, find the supabase calls.

> **TASK — Predict a break in lib/core/theme/monochrome_workspace_colors.dart**
> Name one line above. Describe the user-visible bug if you delete it. Then restore it in your mind — do not actually break a working tree unless you are on a branch.

# Line lesson — lib/core/theme/monochrome_workspace_theme.dart

Four visual styles × light/dark Material 3 themes. This file (monochrome workspace theme) is one concrete piece of that layer.

No top-level class/provider parsed (the file may be a barrel export or use syntax the lesson parser skips). Read it as glue code.

## Why these lines exist

**L6.** `class MonochromeWorkspaceTheme {`

Type definition. If this is a widget, find build(). If this is a repository, find the supabase calls.

> **TASK — Predict a break in lib/core/theme/monochrome_workspace_theme.dart**
> Name one line above. Describe the user-visible bug if you delete it. Then restore it in your mind — do not actually break a working tree unless you are on a branch.

# Line lesson — lib/core/theme/nature_paper_colors.dart

Four visual styles × light/dark Material 3 themes. This file (nature paper colors) is one concrete piece of that layer.

No top-level class/provider parsed (the file may be a barrel export or use syntax the lesson parser skips). Read it as glue code.

## Why these lines exist

**L3.** `class NaturePaperColors {`

Type definition. If this is a widget, find build(). If this is a repository, find the supabase calls.

> **TASK — Predict a break in lib/core/theme/nature_paper_colors.dart**
> Name one line above. Describe the user-visible bug if you delete it. Then restore it in your mind — do not actually break a working tree unless you are on a branch.

# Line lesson — lib/core/theme/nature_paper_theme.dart

Four visual styles × light/dark Material 3 themes. This file (nature paper theme) is one concrete piece of that layer.

No top-level class/provider parsed (the file may be a barrel export or use syntax the lesson parser skips). Read it as glue code.

## Why these lines exist

**L6.** `class NaturePaperTheme {`

Type definition. If this is a widget, find build(). If this is a repository, find the supabase calls.

> **TASK — Predict a break in lib/core/theme/nature_paper_theme.dart**
> Name one line above. Describe the user-visible bug if you delete it. Then restore it in your mind — do not actually break a working tree unless you are on a branch.

# Line lesson — lib/core/theme/neumorphic.dart

Four visual styles × light/dark Material 3 themes. This file (neumorphic) is one concrete piece of that layer.

No top-level class/provider parsed (the file may be a barrel export or use syntax the lesson parser skips). Read it as glue code.

## Why these lines exist

**L8.** `enum NeuElevation { flat, raised, floating, pressed }`

Closed set of values. Keep it aligned with the Postgres enum or the fromString helper.

**L10.** `class Neumorphic {`

Type definition. If this is a widget, find build(). If this is a repository, find the supabase calls.

**L131.** `class NeuIconWell extends StatelessWidget {`

Type definition. If this is a widget, find build(). If this is a repository, find the supabase calls.

**L232.** `class NeuAvatar extends StatelessWidget {`

Type definition. If this is a widget, find build(). If this is a repository, find the supabase calls.

**L269.** `class NeuSearchField extends StatelessWidget {`

Type definition. If this is a widget, find build(). If this is a repository, find the supabase calls.

**L327.** `class NeuPressable extends StatefulWidget {`

Type definition. If this is a widget, find build(). If this is a repository, find the supabase calls.

**L351.** `class _NeuPressableState extends State<NeuPressable> {`

Type definition. If this is a widget, find build(). If this is a repository, find the supabase calls.

> **TASK — Predict a break in lib/core/theme/neumorphic.dart**
> Name one line above. Describe the user-visible bug if you delete it. Then restore it in your mind — do not actually break a working tree unless you are on a branch.

# Line lesson — lib/core/theme/soft_neumorphism_colors.dart

Four visual styles × light/dark Material 3 themes. This file (soft neumorphism colors) is one concrete piece of that layer.

No top-level class/provider parsed (the file may be a barrel export or use syntax the lesson parser skips). Read it as glue code.

## Why these lines exist

**L3.** `class SoftNeumorphismColors {`

Type definition. If this is a widget, find build(). If this is a repository, find the supabase calls.

> **TASK — Predict a break in lib/core/theme/soft_neumorphism_colors.dart**
> Name one line above. Describe the user-visible bug if you delete it. Then restore it in your mind — do not actually break a working tree unless you are on a branch.

# Line lesson — lib/core/theme/soft_neumorphism_theme.dart

Four visual styles × light/dark Material 3 themes. This file (soft neumorphism theme) is one concrete piece of that layer.

No top-level class/provider parsed (the file may be a barrel export or use syntax the lesson parser skips). Read it as glue code.

## Why these lines exist

**L6.** `class SoftNeumorphismTheme {`

Type definition. If this is a widget, find build(). If this is a repository, find the supabase calls.

> **TASK — Predict a break in lib/core/theme/soft_neumorphism_theme.dart**
> Name one line above. Describe the user-visible bug if you delete it. Then restore it in your mind — do not actually break a working tree unless you are on a branch.

# Line lesson — lib/core/utils/responsive.dart

Responsive breakpoints and voice playback. This file (responsive) is one concrete piece of that layer.

No top-level class/provider parsed (the file may be a barrel export or use syntax the lesson parser skips). Read it as glue code.

## Why these lines exist

**L4.** `class Breakpoints {`

Type definition. If this is a widget, find build(). If this is a repository, find the supabase calls.

> **TASK — Predict a break in lib/core/utils/responsive.dart**
> Name one line above. Describe the user-visible bug if you delete it. Then restore it in your mind — do not actually break a working tree unless you are on a branch.

# Line lesson — lib/core/utils/time_of_day_greeting.dart

Responsive breakpoints and voice playback. This file (time of day greeting) is one concrete piece of that layer.

No top-level class/provider parsed (the file may be a barrel export or use syntax the lesson parser skips). Read it as glue code.

## Why these lines exist

This file is mostly layout, colors, or pure functions. That is still product code: a theme token file is how Nature Paper stays consistent. Read it top to bottom once, then return when a screen imports it.

> **TASK — Predict a break in lib/core/utils/time_of_day_greeting.dart**
> Name one line above. Describe the user-visible bug if you delete it. Then restore it in your mind — do not actually break a working tree unless you are on a branch.

# Line lesson — lib/core/utils/voice_playback.dart

Responsive breakpoints and voice playback. This file (voice playback) is one concrete piece of that layer.

No top-level class/provider parsed (the file may be a barrel export or use syntax the lesson parser skips). Read it as glue code.

## Why these lines exist

**L9.** `class DetectedAudioFormat {`

Type definition. If this is a widget, find build(). If this is a repository, find the supabase calls.

**L124.** `class VoicePlaybackController extends ChangeNotifier {`

Type definition. If this is a widget, find build(). If this is a repository, find the supabase calls.

> **TASK — Predict a break in lib/core/utils/voice_playback.dart**
> Name one line above. Describe the user-visible bug if you delete it. Then restore it in your mind — do not actually break a working tree unless you are on a branch.

# Line lesson — lib/l10n/domain_labels.dart

ARB translations and generated AppLocalizations. This file (domain labels) is one concrete piece of that layer.

No top-level class/provider parsed (the file may be a barrel export or use syntax the lesson parser skips). Read it as glue code.

## Why these lines exist

This file is mostly layout, colors, or pure functions. That is still product code: a theme token file is how Nature Paper stays consistent. Read it top to bottom once, then return when a screen imports it.

> **TASK — Predict a break in lib/l10n/domain_labels.dart**
> Name one line above. Describe the user-visible bug if you delete it. Then restore it in your mind — do not actually break a working tree unless you are on a branch.

# Line lesson — lib/l10n/l10n_x.dart

ARB translations and generated AppLocalizations. This file (l10n x) is one concrete piece of that layer.

No top-level class/provider parsed (the file may be a barrel export or use syntax the lesson parser skips). Read it as glue code.

## Why these lines exist

This file is mostly layout, colors, or pure functions. That is still product code: a theme token file is how Nature Paper stays consistent. Read it top to bottom once, then return when a screen imports it.

> **TASK — Predict a break in lib/l10n/l10n_x.dart**
> Name one line above. Describe the user-visible bug if you delete it. Then restore it in your mind — do not actually break a working tree unless you are on a branch.

# Line lesson — lib/l10n/nav_labels.dart

ARB translations and generated AppLocalizations. This file (nav labels) is one concrete piece of that layer.

No top-level class/provider parsed (the file may be a barrel export or use syntax the lesson parser skips). Read it as glue code.

## Why these lines exist

This file is mostly layout, colors, or pure functions. That is still product code: a theme token file is how Nature Paper stays consistent. Read it top to bottom once, then return when a screen imports it.

> **TASK — Predict a break in lib/l10n/nav_labels.dart**
> Name one line above. Describe the user-visible bug if you delete it. Then restore it in your mind — do not actually break a working tree unless you are on a branch.

# Line lesson — lib/main.dart

Process entry: load env, init Supabase, wrap ProviderScope, run MaterialApp.router.

No top-level class/provider parsed (the file may be a barrel export or use syntax the lesson parser skips). Read it as glue code.

## Why these lines exist

**L37.** `ProviderScope(`

Riverpod binding. Name it after the value it exposes.

**L39.** `appStyleProvider.overrideWith((ref) {`

Riverpod binding. Name it after the value it exposes.

**L41.** `ref.listen(currentProfileProvider, (prev, next) {`

Riverpod binding. Name it after the value it exposes.

**L49.** `themeModeProvider.overrideWith((ref) {`

Riverpod binding. Name it after the value it exposes.

**L54.** `ref.listen(currentProfileProvider, (prev, next) {`

Riverpod binding. Name it after the value it exposes.

**L68.** `class MuStudyApp extends ConsumerWidget {`

Type definition. If this is a widget, find build(). If this is a repository, find the supabase calls.

**L73.** `final router = ref.watch(routerProvider);`

Rebuild this widget/provider when the dependency changes. Do not put watch in a click handler.

**L74.** `final locale = ref.watch(localeProvider);`

Rebuild this widget/provider when the dependency changes. Do not put watch in a click handler.

**L75.** `final themeMode = ref.watch(themeModeProvider);`

Rebuild this widget/provider when the dependency changes. Do not put watch in a click handler.

**L76.** `final style = ref.watch(appStyleProvider);`

Rebuild this widget/provider when the dependency changes. Do not put watch in a click handler.

> **TASK — Predict a break in lib/main.dart**
> Name one line above. Describe the user-visible bug if you delete it. Then restore it in your mind — do not actually break a working tree unless you are on a branch.

# Line lesson — lib/models/assignment.dart

JSON ↔ Dart domain types. Manual fromJson, not Freezed in this repo. This file (assignment) is one concrete piece of that layer.

No top-level class/provider parsed (the file may be a barrel export or use syntax the lesson parser skips). Read it as glue code.

## Why these lines exist

**L3.** `class Assignment {`

Type definition. If this is a widget, find build(). If this is a repository, find the supabase calls.

**L54.** `class TaskItem {`

Type definition. If this is a widget, find build(). If this is a repository, find the supabase calls.

**L86.** `class Submission {`

Type definition. If this is a widget, find build(). If this is a repository, find the supabase calls.

> **TASK — Predict a break in lib/models/assignment.dart**
> Name one line above. Describe the user-visible bug if you delete it. Then restore it in your mind — do not actually break a working tree unless you are on a branch.

# Line lesson — lib/models/attendance.dart

JSON ↔ Dart domain types. Manual fromJson, not Freezed in this repo. This file (attendance) is one concrete piece of that layer.

No top-level class/provider parsed (the file may be a barrel export or use syntax the lesson parser skips). Read it as glue code.

## Why these lines exist

**L3.** `class AttendanceRecord {`

Type definition. If this is a widget, find build(). If this is a repository, find the supabase calls.

**L37.** `class AttendanceStats {`

Type definition. If this is a widget, find build(). If this is a repository, find the supabase calls.

> **TASK — Predict a break in lib/models/attendance.dart**
> Name one line above. Describe the user-visible bug if you delete it. Then restore it in your mind — do not actually break a working tree unless you are on a branch.

# Line lesson — lib/models/chat.dart

JSON ↔ Dart domain types. Manual fromJson, not Freezed in this repo. This file (chat) is one concrete piece of that layer.

No top-level class/provider parsed (the file may be a barrel export or use syntax the lesson parser skips). Read it as glue code.

## Why these lines exist

**L3.** `class ChatRoomSummary {`

Type definition. If this is a widget, find build(). If this is a repository, find the supabase calls.

**L82.** `class ChatMessage {`

Type definition. If this is a widget, find build(). If this is a repository, find the supabase calls.

**L241.** `.map((r) => ChatReaction.fromJson(Map<String, dynamic>.from(r)))`

PostgREST table access. RLS still applies. The string is the Postgres table or view name.

**L250.** `replyTo = ChatReplyPreview.fromJson(Map<String, dynamic>.from(replyRaw));`

PostgREST table access. RLS still applies. The string is the Postgres table or view name.

**L281.** `class ChatReplyPreview {`

Type definition. If this is a widget, find build(). If this is a repository, find the supabase calls.

**L358.** `class ChatReaction {`

Type definition. If this is a widget, find build(). If this is a repository, find the supabase calls.

> **TASK — Predict a break in lib/models/chat.dart**
> Name one line above. Describe the user-visible bug if you delete it. Then restore it in your mind — do not actually break a working tree unless you are on a branch.

# Line lesson — lib/models/enums.dart

JSON ↔ Dart domain types. Manual fromJson, not Freezed in this repo. This file (enums) is one concrete piece of that layer.

No top-level class/provider parsed (the file may be a barrel export or use syntax the lesson parser skips). Read it as glue code.

## Why these lines exist

**L1.** `enum UserRole { student, teacher, admin }`

Closed set of values. Keep it aligned with the Postgres enum or the fromString helper.

**L3.** `enum Sphere { math, english }`

Closed set of values. Keep it aligned with the Postgres enum or the fromString helper.

**L5.** `enum AssignmentType { staticAssignment, homeworkPack }`

Closed set of values. Keep it aligned with the Postgres enum or the fromString helper.

**L7.** `enum AttendanceStatus { present, absent, late, excused }`

Closed set of values. Keep it aligned with the Postgres enum or the fromString helper.

**L9.** `enum SubmissionStatus { pending, submitted, reviewed }`

Closed set of values. Keep it aligned with the Postgres enum or the fromString helper.

**L11.** `enum ChatMessageType { text, voice, image, video, file }`

Closed set of values. Keep it aligned with the Postgres enum or the fromString helper.

**L42.** `enum MarkCategory {`

Closed set of values. Keep it aligned with the Postgres enum or the fromString helper.

> **TASK — Predict a break in lib/models/enums.dart**
> Name one line above. Describe the user-visible bug if you delete it. Then restore it in your mind — do not actually break a working tree unless you are on a branch.

# Line lesson — lib/models/mark.dart

JSON ↔ Dart domain types. Manual fromJson, not Freezed in this repo. This file (mark) is one concrete piece of that layer.

No top-level class/provider parsed (the file may be a barrel export or use syntax the lesson parser skips). Read it as glue code.

## Why these lines exist

**L3.** `class Mark {`

Type definition. If this is a widget, find build(). If this is a repository, find the supabase calls.

**L74.** `class GroupMember {`

Type definition. If this is a widget, find build(). If this is a repository, find the supabase calls.

> **TASK — Predict a break in lib/models/mark.dart**
> Name one line above. Describe the user-visible bug if you delete it. Then restore it in your mind — do not actually break a working tree unless you are on a branch.

# Line lesson — lib/models/models.dart

JSON ↔ Dart domain types. Manual fromJson, not Freezed in this repo. This file (models) is one concrete piece of that layer.

No top-level class/provider parsed (the file may be a barrel export or use syntax the lesson parser skips). Read it as glue code.

## Why these lines exist

This file is mostly layout, colors, or pure functions. That is still product code: a theme token file is how Nature Paper stays consistent. Read it top to bottom once, then return when a screen imports it.

> **TASK — Predict a break in lib/models/models.dart**
> Name one line above. Describe the user-visible bug if you delete it. Then restore it in your mind — do not actually break a working tree unless you are on a branch.

# Line lesson — lib/models/notification.dart

JSON ↔ Dart domain types. Manual fromJson, not Freezed in this repo. This file (notification) is one concrete piece of that layer.

No top-level class/provider parsed (the file may be a barrel export or use syntax the lesson parser skips). Read it as glue code.

## Why these lines exist

**L1.** `class AppNotification {`

Type definition. If this is a widget, find build(). If this is a repository, find the supabase calls.

**L42.** `class Announcement {`

Type definition. If this is a widget, find build(). If this is a repository, find the supabase calls.

> **TASK — Predict a break in lib/models/notification.dart**
> Name one line above. Describe the user-visible bug if you delete it. Then restore it in your mind — do not actually break a working tree unless you are on a branch.

# Line lesson — lib/models/profile.dart

JSON ↔ Dart domain types. Manual fromJson, not Freezed in this repo. This file (profile) is one concrete piece of that layer.

No top-level class/provider parsed (the file may be a barrel export or use syntax the lesson parser skips). Read it as glue code.

## Why these lines exist

**L3.** `class Profile {`

Type definition. If this is a widget, find build(). If this is a repository, find the supabase calls.

**L55.** `class TeacherProfile {`

Type definition. If this is a widget, find build(). If this is a repository, find the supabase calls.

**L75.** `class StudentProfile {`

Type definition. If this is a widget, find build(). If this is a repository, find the supabase calls.

**L89.** `class StudyGroup {`

Type definition. If this is a widget, find build(). If this is a repository, find the supabase calls.

> **TASK — Predict a break in lib/models/profile.dart**
> Name one line above. Describe the user-visible bug if you delete it. Then restore it in your mind — do not actually break a working tree unless you are on a branch.

# Line lesson — lib/providers/admin/admin_providers.dart

Users, groups, analytics, academic years, mass generator. This file (admin providers) is one concrete piece of that layer.

No top-level class/provider parsed (the file may be a barrel export or use syntax the lesson parser skips). Read it as glue code.

## Why these lines exist

**L11.** `.from(table)`

PostgREST table access. RLS still applies. The string is the Postgres table or view name.

**L12.** `.select('id')`

Read columns. Narrow the select when the row is wide; '*' is acceptable for small domain rows.

**L17.** `final adminPlatformStatsProvider = FutureProvider<Map<String, int>>((`

Riverpod binding. Name it after the value it exposes.

**L34.** `final adminGroupsProvider = FutureProvider<List<Map<String, dynamic>>>((`

Riverpod binding. Name it after the value it exposes.

**L38.** `.from('groups')`

PostgREST table access. RLS still applies. The string is the Postgres table or view name.

**L39.** `.select('id, title, teachers(sphere, profiles(full_name))')`

Read columns. Narrow the select when the row is wide; '*' is acceptable for small domain rows.

**L41.** `return rows.map((e) => Map<String, dynamic>.from(e)).toList();`

PostgREST table access. RLS still applies. The string is the Postgres table or view name.

**L44.** `final adminAnnouncementsProvider = FutureProvider<List<Map<String, dynamic>>>((`

Riverpod binding. Name it after the value it exposes.

**L48.** `.from('announcements')`

PostgREST table access. RLS still applies. The string is the Postgres table or view name.

**L49.** `.select()`

Read columns. Narrow the select when the row is wide; '*' is acceptable for small domain rows.

**L51.** `return rows.map((e) => Map<String, dynamic>.from(e)).toList();`

PostgREST table access. RLS still applies. The string is the Postgres table or view name.

**L54.** `final allProfilesProvider =`

Riverpod binding. Name it after the value it exposes.

**L55.** `AsyncNotifierProvider<AllProfilesNotifier, PageResult<Profile>>(`

Riverpod binding. Name it after the value it exposes.

**L56.** `AllProfilesNotifier.new,`

Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L59.** `class AllProfilesNotifier extends AsyncNotifier<PageResult<Profile>> {`

Type definition. If this is a widget, find build(). If this is a repository, find the supabase calls.

**L66.** `.from('profiles')`

PostgREST table access. RLS still applies. The string is the Postgres table or view name.

**L67.** `.select()`

Read columns. Narrow the select when the row is wide; '*' is acceptable for small domain rows.

**L71.** `rows.map((e) => Profile.fromJson(Map<String, dynamic>.from(e))).toList(),`

PostgREST table access. RLS still applies. The string is the Postgres table or view name.

> **TASK — Predict a break in lib/providers/admin/admin_providers.dart**
> Name one line above. Describe the user-visible bug if you delete it. Then restore it in your mind — do not actually break a working tree unless you are on a branch.

# Line lesson — lib/providers/attendance/attendance_providers.dart

Lesson sessions + attendance upsert. This file (attendance providers) is one concrete piece of that layer.

No top-level class/provider parsed (the file may be a barrel export or use syntax the lesson parser skips). Read it as glue code.

## Why these lines exist

**L29.** `class AttendanceFutureDateException implements Exception {`

Type definition. If this is a widget, find build(). If this is a repository, find the supabase calls.

**L36.** `class AttendanceWeekendException implements Exception {`

Type definition. If this is a widget, find build(). If this is a repository, find the supabase calls.

**L55.** `class AttendanceQuery {`

Type definition. If this is a widget, find build(). If this is a repository, find the supabase calls.

**L59.** `required this.from,`

Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L73.** `other.from == from &&`

Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L80.** `final attendanceRangeProvider =`

Riverpod binding. Name it after the value it exposes.

**L81.** `FutureProvider.family<List<AttendanceRecord>, AttendanceQuery>((`

Riverpod binding. Name it after the value it exposes.

**L86.** `.from('attendance')`

PostgREST table access. RLS still applies. The string is the Postgres table or view name.

**L87.** `.select('*, students(profiles(full_name))')`

Read columns. Narrow the select when the row is wide; '*' is acceptable for small domain rows.

**L88.** `.eq('group_id', query.groupId)`

Equality filter. This is the WHERE clause. Wrong UUID type (profile vs student id) yields empty lists.

**L89.** `.gte('date', dateKey(query.from))`

Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L93.** `filtered = filtered.eq('student_id', query.studentId!);`

Equality filter. This is the WHERE clause. Wrong UUID type (profile vs student id) yields empty lists.

**L98.** `.map((e) => AttendanceRecord.fromJson(Map<String, dynamic>.from(e)))`

PostgREST table access. RLS still applies. The string is the Postgres table or view name.

**L102.** `final attendanceRangeStatsProvider =`

Riverpod binding. Name it after the value it exposes.

**L103.** `Provider.family<AsyncValue<AttendanceStats>, AttendanceQuery>((ref, query) {`

Riverpod binding. Name it after the value it exposes.

**L105.** `.watch(attendanceRangeProvider(query))`

Riverpod binding. Name it after the value it exposes.

**L109.** `final todayAttendanceProvider =`

Riverpod binding. Name it after the value it exposes.

**L110.** `FutureProvider.family<Map<String, AttendanceStatus>, String>((`

Riverpod binding. Name it after the value it exposes.

**L115.** `.from('attendance')`

PostgREST table access. RLS still applies. The string is the Postgres table or view name.

**L116.** `.select('student_id, status')`

Read columns. Narrow the select when the row is wide; '*' is acceptable for small domain rows.

**L117.** `.eq('group_id', groupId)`

Equality filter. This is the WHERE clause. Wrong UUID type (profile vs student id) yields empty lists.

**L118.** `.eq('date', dateKey(DateTime.now()));`

Equality filter. This is the WHERE clause. Wrong UUID type (profile vs student id) yields empty lists.

**L127.** `class AttendanceWeekBucket {`

Type definition. If this is a widget, find build(). If this is a repository, find the supabase calls.

**L141.** `class AttendanceWeekTrend {`

Type definition. If this is a widget, find build(). If this is a repository, find the supabase calls.

**L150.** `final attendanceWeekTrendProvider =`

Riverpod binding. Name it after the value it exposes.

**L151.** `FutureProvider.family<AttendanceWeekTrend, String>((ref, groupId) async {`

Riverpod binding. Name it after the value it exposes.

**L158.** `.from('attendance')`

PostgREST table access. RLS still applies. The string is the Postgres table or view name.

**L159.** `.select('status, date')`

Read columns. Narrow the select when the row is wide; '*' is acceptable for small domain rows.

**L160.** `.eq('group_id', groupId)`

Equality filter. This is the WHERE clause. Wrong UUID type (profile vs student id) yields empty lists.

**L218.** `await supabase.rpc(`

Remote procedure call. Authorization and writes that are too complex for a single RLS policy often live here (login email, admin create user, unread counts).

**L222.** `await supabase.from('attendance').upsert({`

PostgREST table access. RLS still applies. The string is the Postgres table or view name.

**L240.** `await supabase.rpc(`

Remote procedure call. Authorization and writes that are too complex for a single RLS policy often live here (login email, admin create user, unread counts).

**L255.** `.from('attendance')`

PostgREST table access. RLS still applies. The string is the Postgres table or view name.

**L256.** `.upsert(rows, onConflict: 'group_id,student_id,date');`

Insert-or-update. Submissions and attendance use this so retrying is safe.

**TASK — Predict a break in lib/providers/attendance/attendance_providers.dart**
Name one line above. Describe the user-visible bug if you delete it. Then restore it in your mind — do not actually break a working tree unless you are on a branch.

# Line lesson — lib/providers/auth/auth_provider.dart

Session stream, username login RPC, profile/teacher/student loaders. This file (auth provider) is one concrete piece of that layer.

No top-level class/provider parsed (the file may be a barrel export or use syntax the lesson parser skips). Read it as glue code.

## Why these lines exist

**L8.** `final authStateProvider = StreamProvider<AuthState>((ref) {`

Riverpod binding. Name it after the value it exposes.

**L12.** `class AuthRepository {`

Type definition. If this is a widget, find build(). If this is a repository, find the supabase calls.

**L19.** `final result = await supabase.rpc(`

Remote procedure call. Authorization and writes that are too complex for a single RLS policy often live here (login email, admin create user, unread counts).

**L51.** `final authRepositoryProvider = Provider<AuthRepository>((ref) {`

Riverpod binding. Name it after the value it exposes.

**L52.** `return AuthRepository(ref.watch(cacheServiceProvider).valueOrNull);`

Rebuild this widget/provider when the dependency changes. Do not put watch in a click handler.

**L55.** `class ProfileRepository {`

Type definition. If this is a widget, find build(). If this is a repository, find the supabase calls.

**L66.** `.from('profiles')`

PostgREST table access. RLS still applies. The string is the Postgres table or view name.

**L67.** `.select()`

Read columns. Narrow the select when the row is wide; '*' is acceptable for small domain rows.

**L68.** `.eq('id', uid)`

Equality filter. This is the WHERE clause. Wrong UUID type (profile vs student id) yields empty lists.

**L71.** `final profile = Profile.fromJson(Map<String, dynamic>.from(data));`

PostgREST table access. RLS still applies. The string is the Postgres table or view name.

**L82.** `await supabase.from('profiles').update(updates).eq('id', id);`

PostgREST table access. RLS still applies. The string is the Postgres table or view name.

**L86.** `final profileRepositoryProvider = Provider<ProfileRepository>((ref) {`

Riverpod binding. Name it after the value it exposes.

**L87.** `final cacheAsync = ref.watch(cacheServiceProvider);`

Rebuild this widget/provider when the dependency changes. Do not put watch in a click handler.

**L91.** `final currentProfileProvider = FutureProvider<Profile?>((ref) async {`

Riverpod binding. Name it after the value it exposes.

**L92.** `ref.watch(authStateProvider);`

Rebuild this widget/provider when the dependency changes. Do not put watch in a click handler.

**L93.** `final repo = ref.watch(profileRepositoryProvider);`

Rebuild this widget/provider when the dependency changes. Do not put watch in a click handler.

**L97.** `final teacherProfileProvider = FutureProvider<TeacherProfile?>((ref) async {`

Riverpod binding. Name it after the value it exposes.

**L98.** `final profile = await ref.watch(currentProfileProvider.future);`

Rebuild this widget/provider when the dependency changes. Do not put watch in a click handler.

**L101.** `.from('teachers')`

PostgREST table access. RLS still applies. The string is the Postgres table or view name.

**L102.** `.select()`

Read columns. Narrow the select when the row is wide; '*' is acceptable for small domain rows.

**L103.** `.eq('profile_id', profile.id)`

Equality filter. This is the WHERE clause. Wrong UUID type (profile vs student id) yields empty lists.

**L106.** `return TeacherProfile.fromJson(Map<String, dynamic>.from(data));`

PostgREST table access. RLS still applies. The string is the Postgres table or view name.

**L109.** `final studentProfileProvider = FutureProvider<StudentProfile?>((ref) async {`

Riverpod binding. Name it after the value it exposes.

**L110.** `final profile = await ref.watch(currentProfileProvider.future);`

Rebuild this widget/provider when the dependency changes. Do not put watch in a click handler.

**L113.** `.from('students')`

PostgREST table access. RLS still applies. The string is the Postgres table or view name.

**L114.** `.select()`

Read columns. Narrow the select when the row is wide; '*' is acceptable for small domain rows.

**L115.** `.eq('profile_id', profile.id)`

Equality filter. This is the WHERE clause. Wrong UUID type (profile vs student id) yields empty lists.

**L118.** `return StudentProfile.fromJson(Map<String, dynamic>.from(data));`

PostgREST table access. RLS still applies. The string is the Postgres table or view name.

> **TASK — Predict a break in lib/providers/auth/auth_provider.dart**
> Name one line above. Describe the user-visible bug if you delete it. Then restore it in your mind — do not actually break a working tree unless you are on a branch.

# Line lesson — lib/providers/chat/chat_providers.dart

Room summaries, unread RPC, messages, reactions. This file (chat providers) is one concrete piece of that layer.

No top-level class/provider parsed (the file may be a barrel export or use syntax the lesson parser skips). Read it as glue code.

## Why these lines exist

**L102.** `final chatRoomsProvider = StreamProvider<List<ChatRoomSummary>>((ref) async* {`

Riverpod binding. Name it after the value it exposes.

**L103.** `final profile = await ref.watch(currentProfileProvider.future);`

Rebuild this widget/provider when the dependency changes. Do not put watch in a click handler.

**L111.** `.from('chat_room_summaries')`

PostgREST table access. RLS still applies. The string is the Postgres table or view name.

**L112.** `.select()`

Read columns. Narrow the select when the row is wide; '*' is acceptable for small domain rows.

**L116.** `await supabase.rpc('chat_unread_counts') as List<dynamic>? ?? [];`

Remote procedure call. Authorization and writes that are too complex for a single RLS policy often live here (login email, admin create user, unread counts).

**L119.** `final map = Map<String, dynamic>.from(row as Map);`

PostgREST table access. RLS still applies. The string is the Postgres table or view name.

**L126.** `.map((e) => ChatRoomSummary.fromJson(Map<String, dynamic>.from(e)))`

PostgREST table access. RLS still applies. The string is the Postgres table or view name.

**L146.** `.channel('chat-rooms-${profile.id}')`

Realtime subscription. Dispose the channel on provider dispose or you leak events across logins.

**L147.** `.onPostgresChanges(`

Realtime subscription. Dispose the channel on provider dispose or you leak events across logins.

**L155.** `.onPostgresChanges(`

Realtime subscription. Dispose the channel on provider dispose or you leak events across logins.

**L176.** `final unreadChatCountProvider = Provider<int>((ref) {`

Riverpod binding. Name it after the value it exposes.

**L177.** `final rooms = ref.watch(chatRoomsProvider);`

Rebuild this widget/provider when the dependency changes. Do not put watch in a click handler.

**L184.** `final chatRoomProvider = FutureProvider.family<ChatRoomSummary?, String>((`

Riverpod binding. Name it after the value it exposes.

**L188.** `final rooms = ref.watch(chatRoomsProvider).valueOrNull;`

Rebuild this widget/provider when the dependency changes. Do not put watch in a click handler.

**L195.** `.from('chat_room_summaries')`

PostgREST table access. RLS still applies. The string is the Postgres table or view name.

**L196.** `.select()`

Read columns. Narrow the select when the row is wide; '*' is acceptable for small domain rows.

**L197.** `.eq('id', roomId)`

Equality filter. This is the WHERE clause. Wrong UUID type (profile vs student id) yields empty lists.

**L200.** `return ChatRoomSummary.fromJson(Map<String, dynamic>.from(row));`

PostgREST table access. RLS still applies. The string is the Postgres table or view name.

**L203.** `class ChatMessagesState {`

Type definition. If this is a widget, find build(). If this is a repository, find the supabase calls.

**L227.** `class ChatMessagesNotifier`

Type definition. If this is a widget, find build(). If this is a repository, find the supabase calls.

**L228.** `extends FamilyAsyncNotifier<ChatMessagesState, String> {`

Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L234.** `final profile = await ref.watch(currentProfileProvider.future);`

Rebuild this widget/provider when the dependency changes. Do not put watch in a click handler.

**L239.** `final cache = ref.read(cacheServiceProvider).valueOrNull;`

One-shot access, typical in onPressed. Login uses read(authRepositoryProvider).

**L254.** `.channel('chat-room-$roomId')`

Realtime subscription. Dispose the channel on provider dispose or you leak events across logins.

**L255.** `.onPostgresChanges(`

Realtime subscription. Dispose the channel on provider dispose or you leak events across logins.

**L256.** `event: PostgresChangeEvent.insert,`

Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L260.** `type: PostgresChangeFilterType.eq,`

Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L266.** `.onPostgresChanges(`

Realtime subscription. Dispose the channel on provider dispose or you leak events across logins.

**L267.** `event: PostgresChangeEvent.update,`

Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L271.** `type: PostgresChangeFilterType.eq,`

Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L277.** `.onPostgresChanges(`

Realtime subscription. Dispose the channel on provider dispose or you leak events across logins.

**L278.** `event: PostgresChangeEvent.delete,`

Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L282.** `type: PostgresChangeFilterType.eq,`

Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L288.** `.onPostgresChanges(`

Realtime subscription. Dispose the channel on provider dispose or you leak events across logins.

**L289.** `event: PostgresChangeEvent.insert,`

Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L294.** `.onPostgresChanges(`

Realtime subscription. Dispose the channel on provider dispose or you leak events across logins.

**L295.** `event: PostgresChangeEvent.insert,`

Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L300.** `.onPostgresChanges(`

Realtime subscription. Dispose the channel on provider dispose or you leak events across logins.

**L301.** `event: PostgresChangeEvent.update,`

Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L306.** `.onPostgresChanges(`

Realtime subscription. Dispose the channel on provider dispose or you leak events across logins.

**L307.** `event: PostgresChangeEvent.delete,`

Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L336.** `final cache = ref.read(cacheServiceProvider).valueOrNull;`

One-shot access, typical in onPressed. Login uses read(authRepositoryProvider).

**L357.** `.from('chat_messages')`

PostgREST table access. RLS still applies. The string is the Postgres table or view name.

**L358.** `.select(_chatMessageSelect)`

Read columns. Narrow the select when the row is wide; '*' is acceptable for small domain rows.

**L359.** `.eq('room_id', roomId);`

Equality filter. This is the WHERE clause. Wrong UUID type (profile vs student id) yields empty lists.

**L369.** `.map((e) => ChatMessage.fromJson(Map<String, dynamic>.from(e)))`

PostgREST table access. RLS still applies. The string is the Postgres table or view name.

**L409.** `.from('profiles')`

PostgREST table access. RLS still applies. The string is the Postgres table or view name.

**L410.** `.select('full_name, avatar_url, username, role')`

Read columns. Narrow the select when the row is wide; '*' is acceptable for small domain rows.

**L411.** `.eq('id', senderId)`

Equality filter. This is the WHERE clause. Wrong UUID type (profile vs student id) yields empty lists.

**L414.** `final map = Map<String, dynamic>.from(profileRow);`

PostgREST table access. RLS still applies. The string is the Postgres table or view name.

**L433.** `.from('chat_messages')`

PostgREST table access. RLS still applies. The string is the Postgres table or view name.

**L434.** `.select(`

Read columns. Narrow the select when the row is wide; '*' is acceptable for small domain rows.

**L437.** `.eq('id', replyId)`

Equality filter. This is the WHERE clause. Wrong UUID type (profile vs student id) yields empty lists.

**L440.** `row['reply_to'] = Map<String, dynamic>.from(data);`

PostgREST table access. RLS still applies. The string is the Postgres table or view name.

**L446.** `final row = Map<String, dynamic>.from(record);`

PostgREST table access. RLS still applies. The string is the Postgres table or view name.

**L461.** `final row = Map<String, dynamic>.from(record);`

PostgREST table access. RLS still applies. The string is the Postgres table or view name.

**L517.** `final reaction = ChatReaction.fromJson(Map<String, dynamic>.from(record));`

PostgREST table access. RLS still applies. The string is the Postgres table or view name.

**L563.** `final profile = await ref.read(currentProfileProvider.future);`

One-shot access, typical in onPressed. Login uses read(authRepositoryProvider).

**L569.** `.from('chat_messages')`

PostgREST table access. RLS still applies. The string is the Postgres table or view name.

**L570.** `.insert({`

Creates a row. Failures are usually unique violations or WITH CHECK policy failures.

**L577.** `.select(_chatMessageSelect)`

Read columns. Narrow the select when the row is wide; '*' is acceptable for small domain rows.

**L580.** `final message = ChatMessage.fromJson(Map<String, dynamic>.from(row));`

PostgREST table access. RLS still applies. The string is the Postgres table or view name.

**L599.** `final profile = await ref.read(currentProfileProvider.future);`

One-shot access, typical in onPressed. Login uses read(authRepositoryProvider).

**L617.** `.from(bucket)`

PostgREST table access. RLS still applies. The string is the Postgres table or view name.

**L626.** `.from(bucket)`

PostgREST table access. RLS still applies. The string is the Postgres table or view name.

**L627.** `.createSignedUrl(path, chatSignedUrlTtlSeconds);`

Storage read. Private buckets need a signed URL; avatars may use getPublicUrl.

**L643.** `.from('chat_messages')`

PostgREST table access. RLS still applies. The string is the Postgres table or view name.

**L644.** `.insert({`

Creates a row. Failures are usually unique violations or WITH CHECK policy failures.

**L654.** `.select(_chatMessageSelect)`

Read columns. Narrow the select when the row is wide; '*' is acceptable for small domain rows.

**L658.** `final message = ChatMessage.fromJson(Map<String, dynamic>.from(row));`

PostgREST table access. RLS still applies. The string is the Postgres table or view name.

**L673.** `.from('chat_messages')`

PostgREST table access. RLS still applies. The string is the Postgres table or view name.

**L674.** `.update({'text_content': trimmed})`

Mutates matching rows. Silent zero rows usually means SELECT policy is missing for UPDATE.

**L675.** `.eq('id', messageId);`

Equality filter. This is the WHERE clause. Wrong UUID type (profile vs student id) yields empty lists.

**L703.** `await supabase.from('chat_messages').update({`

PostgREST table access. RLS still applies. The string is the Postgres table or view name.

**L711.** `final profile = await ref.read(currentProfileProvider.future);`

One-shot access, typical in onPressed. Login uses read(authRepositoryProvider).

**L754.** `await supabase.rpc(`

Remote procedure call. Authorization and writes that are too complex for a single RLS policy often live here (login email, admin create user, unread counts).

**L761.** `final profile = await ref.read(currentProfileProvider.future);`

One-shot access, typical in onPressed. Login uses read(authRepositoryProvider).

**L765.** `.from('chat_messages')`

PostgREST table access. RLS still applies. The string is the Postgres table or view name.

**L766.** `.select('id')`

Read columns. Narrow the select when the row is wide; '*' is acceptable for small domain rows.

**L767.** `.eq('room_id', arg)`

Equality filter. This is the WHERE clause. Wrong UUID type (profile vs student id) yields empty lists.

**L768.** `.eq('is_deleted', false)`

Equality filter. This is the WHERE clause. Wrong UUID type (profile vs student id) yields empty lists.

**L777.** `.from('message_reads')`

PostgREST table access. RLS still applies. The string is the Postgres table or view name.

**L778.** `.select('message_id')`

Read columns. Narrow the select when the row is wide; '*' is acceptable for small domain rows.

**L779.** `.eq('user_id', profile.id)`

Equality filter. This is the WHERE clause. Wrong UUID type (profile vs student id) yields empty lists.

**L791.** `.from('message_reads')`

PostgREST table access. RLS still applies. The string is the Postgres table or view name.

**L792.** `.upsert(toInsert, onConflict: 'message_id,user_id');`

Insert-or-update. Submissions and attendance use this so retrying is safe.

**L793.** `ref.invalidate(chatRoomsProvider);`

Drop cached AsyncValue so the next watch refetches (after login or a mutation).

**L797.** `final chatMessagesProvider =`

Riverpod binding. Name it after the value it exposes.

**L798.** `AsyncNotifierProvider.family<`

Riverpod binding. Name it after the value it exposes.

**L799.** `ChatMessagesNotifier,`

Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L802.** `>(ChatMessagesNotifier.new);`

Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

> **TASK — Predict a break in lib/providers/chat/chat_providers.dart**
> Name one line above. Describe the user-visible bug if you delete it. Then restore it in your mind — do not actually break a working tree unless you are on a branch.

# Line lesson — lib/providers/focus/focus_session_provider.dart

Local Pomodoro/free timer persisted in SharedPreferences. This file (focus session provider) is one concrete piece of that layer.

No top-level class/provider parsed (the file may be a barrel export or use syntax the lesson parser skips). Read it as glue code.

## Why these lines exist

**L10.** `enum FocusTimerMode { pomodoro, free }`

Closed set of values. Keep it aligned with the Postgres enum or the fromString helper.

**L14.** `class FocusSession {`

Type definition. If this is a widget, find build(). If this is a repository, find the supabase calls.

**L93.** `class FocusSummary {`

Type definition. If this is a widget, find build(). If this is a repository, find the supabase calls.

**L121.** `class FocusSessionState {`

Type definition. If this is a widget, find build(). If this is a repository, find the supabase calls.

**L143.** `final focusSessionProvider =`

Riverpod binding. Name it after the value it exposes.

**L144.** `StateNotifierProvider<FocusSessionController, FocusSessionState>((ref) {`

Riverpod binding. Name it after the value it exposes.

**L148.** `final focusChatMutedProvider = Provider<bool>((ref) {`

Riverpod binding. Name it after the value it exposes.

**L149.** `return ref.watch(focusSessionProvider).isActive;`

Rebuild this widget/provider when the dependency changes. Do not put watch in a click handler.

**L152.** `class FocusSessionController extends StateNotifier<FocusSessionState> {`

Type definition. If this is a widget, find build(). If this is a repository, find the supabase calls.

> **TASK — Predict a break in lib/providers/focus/focus_session_provider.dart**
> Name one line above. Describe the user-visible bug if you delete it. Then restore it in your mind — do not actually break a working tree unless you are on a branch.

# Line lesson — lib/providers/groups/group_providers.dart

Teacher-owned and student-membership groups. This file (group providers) is one concrete piece of that layer.

No top-level class/provider parsed (the file may be a barrel export or use syntax the lesson parser skips). Read it as glue code.

## Why these lines exist

**L6.** `final myGroupsProvider = FutureProvider<List<StudyGroup>>((ref) async {`

Riverpod binding. Name it after the value it exposes.

**L7.** `final profile = await ref.watch(currentProfileProvider.future);`

Rebuild this widget/provider when the dependency changes. Do not put watch in a click handler.

**L11.** `final teacher = await ref.watch(teacherProfileProvider.future);`

Rebuild this widget/provider when the dependency changes. Do not put watch in a click handler.

**L14.** `.from('groups')`

PostgREST table access. RLS still applies. The string is the Postgres table or view name.

**L15.** `.select()`

Read columns. Narrow the select when the row is wide; '*' is acceptable for small domain rows.

**L16.** `.eq('teacher_id', teacher.id)`

Equality filter. This is the WHERE clause. Wrong UUID type (profile vs student id) yields empty lists.

**L19.** `.map((e) => StudyGroup.fromJson(Map<String, dynamic>.from(e)))`

PostgREST table access. RLS still applies. The string is the Postgres table or view name.

**L24.** `final student = await ref.watch(studentProfileProvider.future);`

Rebuild this widget/provider when the dependency changes. Do not put watch in a click handler.

**L27.** `.from('group_students')`

PostgREST table access. RLS still applies. The string is the Postgres table or view name.

**L28.** `.select('groups(*)')`

Read columns. Narrow the select when the row is wide; '*' is acceptable for small domain rows.

**L29.** `.eq('student_id', student.id);`

Equality filter. This is the WHERE clause. Wrong UUID type (profile vs student id) yields empty lists.

**L33.** `Map<String, dynamic>.from(e['groups'] as Map),`

PostgREST table access. RLS still applies. The string is the Postgres table or view name.

**L39.** `final rows = await supabase.from('groups').select().order('title');`

PostgREST table access. RLS still applies. The string is the Postgres table or view name.

**L41.** `.map((e) => StudyGroup.fromJson(Map<String, dynamic>.from(e)))`

PostgREST table access. RLS still applies. The string is the Postgres table or view name.

**L45.** `final selectedGroupIdProvider = StateProvider<String?>((ref) => null);`

Riverpod binding. Name it after the value it exposes.

**L47.** `final activeGroupIdProvider = Provider<String?>((ref) {`

Riverpod binding. Name it after the value it exposes.

**L48.** `final selected = ref.watch(selectedGroupIdProvider);`

Rebuild this widget/provider when the dependency changes. Do not put watch in a click handler.

**L49.** `final groups = ref.watch(myGroupsProvider).valueOrNull ?? const [];`

Rebuild this widget/provider when the dependency changes. Do not put watch in a click handler.

**L54.** `final groupMembersProvider = FutureProvider.family<List<GroupMember>, String>((`

Riverpod binding. Name it after the value it exposes.

**L59.** `.from('group_students')`

PostgREST table access. RLS still applies. The string is the Postgres table or view name.

**L60.** `.select('students(id, profiles(full_name, username))')`

Read columns. Narrow the select when the row is wide; '*' is acceptable for small domain rows.

**L61.** `.eq('group_id', groupId);`

Equality filter. This is the WHERE clause. Wrong UUID type (profile vs student id) yields empty lists.

**L63.** `.map((e) => GroupMember.fromGroupStudentRow(Map<String, dynamic>.from(e)))`

PostgREST table access. RLS still applies. The string is the Postgres table or view name.

> **TASK — Predict a break in lib/providers/groups/group_providers.dart**
> Name one line above. Describe the user-visible bug if you delete it. Then restore it in your mind — do not actually break a working tree unless you are on a branch.

# Line lesson — lib/providers/homework/assignment_providers.dart

Assignments, tasks, teacher submissions queue. This file (assignment providers) is one concrete piece of that layer.

No top-level class/provider parsed (the file may be a barrel export or use syntax the lesson parser skips). Read it as glue code.

## Why these lines exist

**L10.** `final assignmentsProvider =`

Riverpod binding. Name it after the value it exposes.

**L11.** `AsyncNotifierProvider.family<`

Riverpod binding. Name it after the value it exposes.

**L12.** `AssignmentsNotifier,`

Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L15.** `>(AssignmentsNotifier.new);`

Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L17.** `class AssignmentsNotifier`

Type definition. If this is a widget, find build(). If this is a repository, find the supabase calls.

**L18.** `extends FamilyAsyncNotifier<PageResult<Assignment>, String?> {`

Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L23.** `final cache = ref.watch(cacheServiceProvider).valueOrNull;`

Rebuild this widget/provider when the dependency changes. Do not put watch in a click handler.

**L27.** `var query = supabase.from('assignments').select();`

PostgREST table access. RLS still applies. The string is the Postgres table or view name.

**L28.** `if (arg != null) query = query.eq('group_id', arg!);`

Equality filter. This is the WHERE clause. Wrong UUID type (profile vs student id) yields empty lists.

**L32.** `final list = rows.map((e) => Map<String, dynamic>.from(e)).toList();`

PostgREST table access. RLS still applies. The string is the Postgres table or view name.

**L63.** `final assignmentDetailProvider = FutureProvider.family<Assignment?, String>((`

Riverpod binding. Name it after the value it exposes.

**L68.** `.from('assignments')`

PostgREST table access. RLS still applies. The string is the Postgres table or view name.

**L69.** `.select()`

Read columns. Narrow the select when the row is wide; '*' is acceptable for small domain rows.

**L70.** `.eq('id', id)`

Equality filter. This is the WHERE clause. Wrong UUID type (profile vs student id) yields empty lists.

**L73.** `return Assignment.fromJson(Map<String, dynamic>.from(data));`

PostgREST table access. RLS still applies. The string is the Postgres table or view name.

**L76.** `final tasksProvider = FutureProvider.family<List<TaskItem>, String>((`

Riverpod binding. Name it after the value it exposes.

**L81.** `.from('tasks')`

PostgREST table access. RLS still applies. The string is the Postgres table or view name.

**L82.** `.select()`

Read columns. Narrow the select when the row is wide; '*' is acceptable for small domain rows.

**L83.** `.eq('assignment_id', assignmentId)`

Equality filter. This is the WHERE clause. Wrong UUID type (profile vs student id) yields empty lists.

**L86.** `.map((e) => TaskItem.fromJson(Map<String, dynamic>.from(e)))`

PostgREST table access. RLS still applies. The string is the Postgres table or view name.

**L90.** `final assignmentProgressProvider = FutureProvider.family<double, String>((`

Riverpod binding. Name it after the value it exposes.

**L94.** `final student = await ref.watch(studentProfileProvider.future);`

Rebuild this widget/provider when the dependency changes. Do not put watch in a click handler.

**L98.** `.from('tasks')`

PostgREST table access. RLS still applies. The string is the Postgres table or view name.

**L99.** `.select('id')`

Read columns. Narrow the select when the row is wide; '*' is acceptable for small domain rows.

**L100.** `.eq('assignment_id', assignmentId);`

Equality filter. This is the WHERE clause. Wrong UUID type (profile vs student id) yields empty lists.

**L105.** `.from('submissions')`

PostgREST table access. RLS still applies. The string is the Postgres table or view name.

**L106.** `.select('task_id')`

Read columns. Narrow the select when the row is wide; '*' is acceptable for small domain rows.

**L107.** `.eq('student_id', student.id)`

Equality filter. This is the WHERE clause. Wrong UUID type (profile vs student id) yields empty lists.

**L108.** `.eq('is_completed', true)`

Equality filter. This is the WHERE clause. Wrong UUID type (profile vs student id) yields empty lists.

> Name one line above. Describe the user-visible bug if you delete it. Then restore it in your mind — do not actually break a working tree unless you are on a branch.

# Line lesson — lib/providers/notifications/notification_providers.dart

Realtime inbox + announcements. This file (notification providers) is one concrete piece of that layer.

No top-level class/provider parsed (the file may be a barrel export or use syntax the lesson parser skips). Read it as glue code.

## Why these lines exist

**L10.** `final notificationsProvider = StreamProvider<List<AppNotification>>((`

Riverpod binding. Name it after the value it exposes.

**L13.** `final profile = await ref.watch(currentProfileProvider.future);`

Rebuild this widget/provider when the dependency changes. Do not put watch in a click handler.

**L19.** `final cache = ref.watch(cacheServiceProvider).valueOrNull;`

Rebuild this widget/provider when the dependency changes. Do not put watch in a click handler.

**L23.** `.from('notifications')`

PostgREST table access. RLS still applies. The string is the Postgres table or view name.

**L24.** `.select()`

Read columns. Narrow the select when the row is wide; '*' is acceptable for small domain rows.

**L25.** `.eq('user_id', profile.id)`

Equality filter. This is the WHERE clause. Wrong UUID type (profile vs student id) yields empty lists.

**L28.** `final list = rows.map((e) => Map<String, dynamic>.from(e)).toList();`

PostgREST table access. RLS still applies. The string is the Postgres table or view name.

**L35.** `.channel('notifications-${profile.id}')`

Realtime subscription. Dispose the channel on provider dispose or you leak events across logins.

**L36.** `.onPostgresChanges(`

Realtime subscription. Dispose the channel on provider dispose or you leak events across logins.

**L41.** `type: PostgresChangeFilterType.eq,`

Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L63.** `final unreadNotificationsCountProvider = Provider<int>((ref) {`

Riverpod binding. Name it after the value it exposes.

**L64.** `final notifications = ref.watch(notificationsProvider);`

Rebuild this widget/provider when the dependency changes. Do not put watch in a click handler.

**L71.** `final announcementsProvider =`

Riverpod binding. Name it after the value it exposes.

**L72.** `FutureProvider.family<List<Announcement>, String?>((ref, groupId) async {`

Riverpod binding. Name it after the value it exposes.

**L73.** `var query = supabase.from('announcements').select();`

PostgREST table access. RLS still applies. The string is the Postgres table or view name.

**L74.** `if (groupId != null) query = query.eq('group_id', groupId);`

Equality filter. This is the WHERE clause. Wrong UUID type (profile vs student id) yields empty lists.

**L77.** `.map((e) => Announcement.fromJson(Map<String, dynamic>.from(e)))`

PostgREST table access. RLS still applies. The string is the Postgres table or view name.

**L82.** `await supabase.from('notifications').update({'is_read': true}).eq('id', id);`

PostgREST table access. RLS still applies. The string is the Postgres table or view name.

**L87.** `.from('notifications')`

PostgREST table access. RLS still applies. The string is the Postgres table or view name.

**L88.** `.update({'is_read': true})`

Mutates matching rows. Silent zero rows usually means SELECT policy is missing for UPDATE.

**L89.** `.eq('user_id', userId)`

Equality filter. This is the WHERE clause. Wrong UUID type (profile vs student id) yields empty lists.

**L90.** `.eq('is_read', false);`

Equality filter. This is the WHERE clause. Wrong UUID type (profile vs student id) yields empty lists.

**TASK — Predict a break in lib/providers/notifications/notification_providers.dart**
Name one line above. Describe the user-visible bug if you delete it. Then restore it in your mind — do not actually break a working tree unless you are on a branch.

# Line lesson — lib/providers/settings/locale_provider.dart

Locale, theme mode, AppStyle. This file (locale provider) is one concrete piece of that layer.

No top-level class/provider parsed (the file may be a barrel export or use syntax the lesson parser skips). Read it as glue code.

## Why these lines exist

**L10.** `final localeProvider = StateNotifierProvider<LocaleController, Locale>((ref) {`

Riverpod binding. Name it after the value it exposes.

**L12.** `ref.listen(currentProfileProvider, (prev, next) {`

Riverpod binding. Name it after the value it exposes.

# Line lesson — lib/screens/admin/academic_years/admin_academic_years_screen.dart

Application source used by MU Study. Read the imports first, then the public types, then the widget build or provider body.

No top-level class/provider parsed (the file may be a barrel export or use syntax the lesson parser skips). Read it as glue code.

## Why these lines exist

**L12.** `class AdminAcademicYearsScreen extends ConsumerStatefulWidget {`

Type definition. If this is a widget, find build(). If this is a repository, find the supabase calls.

**L16.** `ConsumerState<AdminAcademicYearsScreen> createState() =>`

Widget that can watch providers. Required for profile/theme/locale.

**L20.** `class _AdminAcademicYearsScreenState`

Type definition. If this is a widget, find build(). If this is a repository, find the supabase calls.

**L21.** `extends ConsumerState<AdminAcademicYearsScreen> {`

Widget that can watch providers. Required for profile/theme/locale.

**L28.** `final row = await supabase.rpc('admin_create_next_academic_year');`

Remote procedure call. Authorization and writes that are too complex for a single RLS policy often live here (login email, admin create user, unread counts).

**L30.** `ref.invalidate(academicYearsProvider);`

Drop cached AsyncValue so the next watch refetches (after login or a mutation).

**L31.** `ref.invalidate(academicTermOptionsProvider);`

Drop cached AsyncValue so the next watch refetches (after login or a mutation).

**L49.** `await supabase.rpc(`

Remote procedure call. Authorization and writes that are too complex for a single RLS policy often live here (login email, admin create user, unread counts).

**L53.** `ref.invalidate(academicYearsProvider);`

Drop cached AsyncValue so the next watch refetches (after login or a mutation).

**L54.** `ref.invalidate(academicTermOptionsProvider);`

Drop cached AsyncValue so the next watch refetches (after login or a mutation).

**L133.** `await supabase.rpc(`

Remote procedure call. Authorization and writes that are too complex for a single RLS policy often live here (login email, admin create user, unread counts).

**L137.** `ref.invalidate(academicYearsProvider);`

Drop cached AsyncValue so the next watch refetches (after login or a mutation).

**L138.** `ref.invalidate(academicTermOptionsProvider);`

Drop cached AsyncValue so the next watch refetches (after login or a mutation).

**L249.** `await supabase.rpc(`

Remote procedure call. Authorization and writes that are too complex for a single RLS policy often live here (login email, admin create user, unread counts).

**L257.** `ref.invalidate(academicYearsProvider);`

Drop cached AsyncValue so the next watch refetches (after login or a mutation).

**L258.** `ref.invalidate(academicTermOptionsProvider);`

Drop cached AsyncValue so the next watch refetches (after login or a mutation).

**L276.** `final years = ref.watch(academicYearsProvider);`

Rebuild this widget/provider when the dependency changes. Do not put watch in a click handler.

**L308.** `ref.invalidate(academicYearsProvider);`

Drop cached AsyncValue so the next watch refetches (after login or a mutation).

**L309.** `await ref.read(academicYearsProvider.future);`

One-shot access, typical in onPressed. Login uses read(authRepositoryProvider).

**L972.** `.read(chatMessagesProvider(widget.roomId).notifier)`

Riverpod binding. Name it after the value it exposes.

**L986.** `.read(chatMessagesProvider(widget.roomId).notifier)`

Riverpod binding. Name it after the value it exposes.

**L1000.** `final room = ref.watch(chatRoomProvider(widget.roomId));`

Rebuild this widget/provider when the dependency changes. Do not put watch in a click handler.

**L1001.** `final messages = ref.watch(chatMessagesProvider(widget.roomId));`

Rebuild this widget/provider when the dependency changes. Do not put watch in a click handler.

**L1002.** `final me = ref.watch(currentProfileProvider).valueOrNull;`

Rebuild this widget/provider when the dependency changes. Do not put watch in a click handler.

**L1007.** `ref.listen(chatMessagesProvider(widget.roomId), (prev, next) {`

Riverpod binding. Name it after the value it exposes.

**L1010.** `ref.listen(currentProfileProvider, (prev, next) {`

Riverpod binding. Name it after the value it exposes.

**L1214.** `.read(`

Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L1215.** `chatMessagesProvider(`

Riverpod binding. Name it after the value it exposes.

**L1217.** `).notifier,`

Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**TASK — Predict a break in lib/screens/chat/room/chat_room_screen.dart**
Name one line above. Describe the user-visible bug if you delete it. Then restore it in your mind — do not actually break a working tree unless you are on a branch.

# Line lesson — lib/screens/chat/room/helpers/chat_list_entries.dart

Application source used by MU Study. Read the imports first, then the public types, then the widget build or provider body.

No top-level class/provider parsed (the file may be a barrel export or use syntax the lesson parser skips). Read it as glue code.

## Why these lines exist

**L3.** `class ChatListEntry {`

Type definition. If this is a widget, find build(). If this is a repository, find the supabase calls.

> **TASK — Predict a break in lib/screens/chat/room/helpers/chat_list_entries.dart**
> Name one line above. Describe the user-visible bug if you delete it. Then restore it in your mind — do not actually break a working tree unless you are on a branch.

# Line lesson — lib/screens/chat/room/helpers/reply_snippets.dart

Application source used by MU Study. Read the imports first, then the public types, then the widget build or provider body.

No top-level class/provider parsed (the file may be a barrel export or use syntax the lesson parser skips). Read it as glue code.

## Why these lines exist

This file is mostly layout, colors, or pure functions. That is still product code: a theme token file is how Nature Paper stays consistent. Read it top to bottom once, then return when a screen imports it.

> Name one line above. Describe the user-visible bug if you delete it. Then restore it in your mind — do not actually break a working tree unless you are on a branch.

# Line lesson — lib/screens/student/focus/widgets/focus_summary_view.dart

Application source used by MU Study. Read the imports first, then the public types, then the widget build or provider body.

No top-level class/provider parsed (the file may be a barrel export or use syntax the lesson parser skips). Read it as glue code.

## Why these lines exist

**L10.** `class FocusSummaryView extends StatelessWidget {`

Type definition. If this is a widget, find build(). If this is a repository, find the supabase calls.

> **TASK — Predict a break in lib/screens/student/focus/widgets/focus_summary_view.dart**
> Name one line above. Describe the user-visible bug if you delete it. Then restore it in your mind — do not actually break a working tree unless you are on a branch.

# Line lesson — lib/screens/student/focus/widgets/soft_fireflies.dart

Application source used by MU Study. Read the imports first, then the public types, then the widget build or provider body.

No top-level class/provider parsed (the file may be a barrel export or use syntax the lesson parser skips). Read it as glue code.

## Why these lines exist

**L5.** `class SoftFireflies extends StatefulWidget {`

Type definition. If this is a widget, find build(). If this is a repository, find the supabase calls.

**L12.** `class _SoftFirefliesState extends State<SoftFireflies>`

Type definition. If this is a widget, find build(). If this is a repository, find the supabase calls.

**L13.** `with SingleTickerProviderStateMixin {`

Riverpod binding. Name it after the value it exposes.

**L34.** `class SoftFirefliesPainter extends CustomPainter {`

Type definition. If this is a widget, find build(). If this is a repository, find the supabase calls.

> **TASK — Predict a break in lib/screens/student/focus/widgets/soft_fireflies.dart**
> Name one line above. Describe the user-visible bug if you delete it. Then restore it in your mind — do not actually break a working tree unless you are on a branch.

# Line lesson — lib/screens/student/home/student_dashboard_screen.dart

Application source used by MU Study. Read the imports first, then the public types, then the widget build or provider body.

No top-level class/provider parsed (the file may be a barrel export or use syntax the lesson parser skips). Read it as glue code.

## Why these lines exist

**L27.** `class StudentDashboardScreen extends ConsumerStatefulWidget {`

Type definition. If this is a widget, find build(). If this is a repository, find the supabase calls.

**L31.** `ConsumerState<StudentDashboardScreen> createState() =>`

Widget that can watch providers. Required for profile/theme/locale.

**L35.** `class _StudentDashboardScreenState`

Type definition. If this is a widget, find build(). If this is a repository, find the supabase calls.

**L36.** `extends ConsumerState<StudentDashboardScreen> {`

Widget that can watch providers. Required for profile/theme/locale.

**L58.** `final profile = ref.watch(currentProfileProvider);`

Rebuild this widget/provider when the dependency changes. Do not put watch in a click handler.

**L59.** `final groupId = ref.watch(activeGroupIdProvider);`

Rebuild this widget/provider when the dependency changes. Do not put watch in a click handler.

**L60.** `final assignments = ref.watch(assignmentsProvider(groupId));`

Rebuild this widget/provider when the dependency changes. Do not put watch in a click handler.

**L61.** `final notifications = ref.watch(notificationsProvider);`

Rebuild this widget/provider when the dependency changes. Do not put watch in a click handler.

**L62.** `final announcements = ref.watch(announcementsProvider(groupId));`

Rebuild this widget/provider when the dependency changes. Do not put watch in a click handler.

**L63.** `final marks = ref.watch(myMarksProvider);`

Rebuild this widget/provider when the dependency changes. Do not put watch in a click handler.

**L64.** `final average = ref.watch(myMarkAverageProvider).valueOrNull;`

Rebuild this widget/provider when the dependency changes. Do not put watch in a click handler.

**L68.** `ref.invalidate(myGroupsProvider);`

Drop cached AsyncValue so the next watch refetches (after login or a mutation).

**L69.** `ref.invalidate(myMarksProvider);`

Drop cached AsyncValue so the next watch refetches (after login or a mutation).

**L70.** `ref.invalidate(myMarkAverageProvider);`

Drop cached AsyncValue so the next watch refetches (after login or a mutation).

**L72.** `ref.invalidate(assignmentsProvider(groupId));`

Drop cached AsyncValue so the next watch refetches (after login or a mutation).

**L73.** `ref.invalidate(announcementsProvider(groupId));`

Drop cached AsyncValue so the next watch refetches (after login or a mutation).

**L305.** `Consumer(`

Widget that can watch providers. Required for profile/theme/locale.

**L307.** `final progressAsync = ref.watch(`

Rebuild this widget/provider when the dependency changes. Do not put watch in a click handler.

**L308.** `assignmentProgressProvider(a.id),`

Riverpod binding. Name it after the value it exposes.

> **TASK — Predict a break in lib/screens/student/home/student_dashboard_screen.dart**
> Name one line above. Describe the user-visible bug if you delete it. Then restore it in your mind — do not actually break a working tree unless you are on a branch.

# Line lesson — lib/screens/student/home/widgets/dashboard_announcements.dart

Application source used by MU Study. Read the imports first, then the public types, then the widget build or provider body.

No top-level class/provider parsed (the file may be a barrel export or use syntax the lesson parser skips). Read it as glue code.

## Why these lines exist

**L6.** `class DashboardAnnouncements extends StatefulWidget {`

Type definition. If this is a widget, find build(). If this is a repository, find the supabase calls.

**L17.** `class _DashboardAnnouncementsState extends State<DashboardAnnouncements> {`

Type definition. If this is a widget, find build(). If this is a repository, find the supabase calls.

> **TASK — Predict a break in lib/screens/student/home/widgets/dashboard_announcements.dart**
> Name one line above. Describe the user-visible bug if you delete it. Then restore it in your mind — do not actually break a working tree unless you are on a branch.

# Line lesson — lib/screens/student/home/widgets/expandable_announcement_card.dart

Application source used by MU Study. Read the imports first, then the public types, then the widget build or provider body.

No top-level class/provider parsed (the file may be a barrel export or use syntax the lesson parser skips). Read it as glue code.

## Why these lines exist

**L9.** `class ExpandableAnnouncementCard extends StatefulWidget {`

Type definition. If this is a widget, find build(). If this is a repository, find the supabase calls.

**L19.** `class _ExpandableAnnouncementCardState`

Type definition. If this is a widget, find build(). If this is a repository, find the supabase calls.

**L20.** `extends State<ExpandableAnnouncementCard> {`

Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

> **TASK — Predict a break in lib/screens/student/home/widgets/expandable_announcement_card.dart**
> Name one line above. Describe the user-visible bug if you delete it. Then restore it in your mind — do not actually break a working tree unless you are on a branch.

# Line lesson — lib/screens/student/homework/student_assignments_screen.dart

Application source used by MU Study. Read the imports first, then the public types, then the widget build or provider body.

No top-level class/provider parsed (the file may be a barrel export or use syntax the lesson parser skips). Read it as glue code.

## Why these lines exist

**L19.** `class StudentAssignmentsScreen extends ConsumerWidget {`

Type definition. If this is a widget, find build(). If this is a repository, find the supabase calls.

**L28.** `final groupId = ref.watch(activeGroupIdProvider);`

Rebuild this widget/provider when the dependency changes. Do not put watch in a click handler.

**L29.** `final assignments = ref.watch(assignmentsProvider(groupId));`

Rebuild this widget/provider when the dependency changes. Do not put watch in a click handler.

**L84.** `.read(assignmentsProvider(groupId).notifier)`

Riverpod binding. Name it after the value it exposes.

**L189.** `class StudentAssignmentDetailScreen extends ConsumerWidget {`

Type definition. If this is a widget, find build(). If this is a repository, find the supabase calls.

**L196.** `final assignment = ref.watch(assignmentDetailProvider(assignmentId));`

Rebuild this widget/provider when the dependency changes. Do not put watch in a click handler.

**L197.** `final tasks = ref.watch(tasksProvider(assignmentId));`

Rebuild this widget/provider when the dependency changes. Do not put watch in a click handler.

**L209.** `ref.invalidate(assignmentDetailProvider(assignmentId));`

Drop cached AsyncValue so the next watch refetches (after login or a mutation).

**L210.** `ref.invalidate(tasksProvider(assignmentId));`

Drop cached AsyncValue so the next watch refetches (after login or a mutation).

> **TASK — Predict a break in lib/screens/student/homework/student_assignments_screen.dart**
> Name one line above. Describe the user-visible bug if you delete it. Then restore it in your mind — do not actually break a working tree unless you are on a branch.

# Line lesson — lib/screens/student/homework/student_task_submit_screen.dart

Application source used by MU Study. Read the imports first, then the public types, then the widget build or provider body.

No top-level class/provider parsed (the file may be a barrel export or use syntax the lesson parser skips). Read it as glue code.

## Why these lines exist

**L21.** `class StudentTaskSubmitScreen extends ConsumerStatefulWidget {`

Type definition. If this is a widget, find build(). If this is a repository, find the supabase calls.

**L27.** `ConsumerState<StudentTaskSubmitScreen> createState() =>`

Widget that can watch providers. Required for profile/theme/locale.

**L33.** `class _StudentTaskSubmitScreenState`

Type definition. If this is a widget, find build(). If this is a repository, find the supabase calls.

**L34.** `extends ConsumerState<StudentTaskSubmitScreen> {`

Widget that can watch providers. Required for profile/theme/locale.

**L54.** `.from('tasks')`

PostgREST table access. RLS still applies. The string is the Postgres table or view name.

**L55.** `.select()`

Read columns. Narrow the select when the row is wide; '*' is acceptable for small domain rows.

**L56.** `.eq('id', widget.taskId)`

Equality filter. This is the WHERE clause. Wrong UUID type (profile vs student id) yields empty lists.

**L58.** `if (task != null) setState(() => _task = Map<String, dynamic>.from(task));`

PostgREST table access. RLS still applies. The string is the Postgres table or view name.

**L60.** `final student = await ref.read(studentProfileProvider.future);`

One-shot access, typical in onPressed. Login uses read(authRepositoryProvider).

**L63.** `.from('submissions')`

PostgREST table access. RLS still applies. The string is the Postgres table or view name.

**L64.** `.select()`

Read columns. Narrow the select when the row is wide; '*' is acceptable for small domain rows.

**L65.** `.eq('task_id', widget.taskId)`

Equality filter. This is the WHERE clause. Wrong UUID type (profile vs student id) yields empty lists.

**L66.** `.eq('student_id', student.id)`

Equality filter. This is the WHERE clause. Wrong UUID type (profile vs student id) yields empty lists.

**L93.** `.from('submissions')`

PostgREST table access. RLS still applies. The string is the Postgres table or view name.

**L100.** `.from('submissions')`

PostgREST table access. RLS still applies. The string is the Postgres table or view name.

**L101.** `.createSignedUrl(path, _signedUrlTtlSeconds);`

Storage read. Private buckets need a signed URL; avatars may use getPublicUrl.

**L112.** `final student = await ref.read(studentProfileProvider.future);`

One-shot access, typical in onPressed. Login uses read(authRepositoryProvider).

**L136.** `final student = await ref.read(studentProfileProvider.future);`

One-shot access, typical in onPressed. Login uses read(authRepositoryProvider).

**L171.** `await supabase.storage.from('submissions').remove([path]);`

PostgREST table access. RLS still applies. The string is the Postgres table or view name.

**L175.** `final student = await ref.read(studentProfileProvider.future);`

One-shot access, typical in onPressed. Login uses read(authRepositoryProvider).

**L179.** `.from('submissions')`

PostgREST table access. RLS still applies. The string is the Postgres table or view name.

**L180.** `.update({'file_url': null})`

Mutates matching rows. Silent zero rows usually means SELECT policy is missing for UPDATE.

**L181.** `.eq('task_id', widget.taskId)`

Equality filter. This is the WHERE clause. Wrong UUID type (profile vs student id) yields empty lists.

**L182.** `.eq('student_id', student.id);`

Equality filter. This is the WHERE clause. Wrong UUID type (profile vs student id) yields empty lists.

**L187.** `final student = await ref.read(studentProfileProvider.future);`

One-shot access, typical in onPressed. Login uses read(authRepositoryProvider).

**L194.** `.from('submissions')`

PostgREST table access. RLS still applies. The string is the Postgres table or view name.

**L206.** `.from('submissions')`

PostgREST table access. RLS still applies. The string is the Postgres table or view name.

**L207.** `.createSignedUrl(path, _signedUrlTtlSeconds);`

Storage read. Private buckets need a signed URL; avatars may use getPublicUrl.

**L230.** `await supabase.storage.from('submissions').remove([path]);`

PostgREST table access. RLS still applies. The string is the Postgres table or view name.

**L234.** `final student = await ref.read(studentProfileProvider.future);`

One-shot access, typical in onPressed. Login uses read(authRepositoryProvider).

**L238.** `.from('submissions')`

PostgREST table access. RLS still applies. The string is the Postgres table or view name.

**L239.** `.update({'voice_url': null})`

Mutates matching rows. Silent zero rows usually means SELECT policy is missing for UPDATE.

**L240.** `.eq('task_id', widget.taskId)`

Equality filter. This is the WHERE clause. Wrong UUID type (profile vs student id) yields empty lists.

**L241.** `.eq('student_id', student.id);`

Equality filter. This is the WHERE clause. Wrong UUID type (profile vs student id) yields empty lists.

**L253.** `final student = await ref.read(studentProfileProvider.future);`

One-shot access, typical in onPressed. Login uses read(authRepositoryProvider).

**L257.** `await supabase.from('submissions').upsert({`

PostgREST table access. RLS still applies. The string is the Postgres table or view name.

**L276.** `ref.invalidate(assignmentProgressProvider);`

Drop cached AsyncValue so the next watch refetches (after login or a mutation).

**L445.** `class _AttachAction extends StatelessWidget {`

Type definition. If this is a widget, find build(). If this is a repository, find the supabase calls.

> **TASK — Predict a break in lib/screens/student/homework/student_task_submit_screen.dart**

> Name one line above. Describe the user-visible bug if you delete it. Then restore it in your mind — do not actually break a working tree unless you are on a branch.

# Line lesson — lib/screens/teacher/attendance/teacher_attendance_screen.dart

Application source used by MU Study. Read the imports first, then the public types, then the widget build or provider body.

No top-level class/provider parsed (the file may be a barrel export or use syntax the lesson parser skips). Read it as glue code.

## Why these lines exist

**L16.** `class TeacherAttendanceScreen extends ConsumerStatefulWidget {`

Type definition. If this is a widget, find build(). If this is a repository, find the supabase calls.

**L20.** `ConsumerState<TeacherAttendanceScreen> createState() =>`

Widget that can watch providers. Required for profile/theme/locale.

**L24.** `class _TeacherAttendanceScreenState`

Type definition. If this is a widget, find build(). If this is a repository, find the supabase calls.

**L25.** `extends ConsumerState<TeacherAttendanceScreen>`

Widget that can watch providers. Required for profile/theme/locale.

**L26.** `with SingleTickerProviderStateMixin {`

Riverpod binding. Name it after the value it exposes.

**L89.** `ref.invalidate(todayAttendanceProvider(groupId));`

Drop cached AsyncValue so the next watch refetches (after login or a mutation).

**L90.** `ref.invalidate(attendanceWeekTrendProvider(groupId));`

Drop cached AsyncValue so the next watch refetches (after login or a mutation).

**L91.** `ref.invalidate(attendanceRangeProvider);`

Drop cached AsyncValue so the next watch refetches (after login or a mutation).

**L150.** `ref.invalidate(todayAttendanceProvider(groupId));`

Drop cached AsyncValue so the next watch refetches (after login or a mutation).

**L151.** `ref.invalidate(attendanceWeekTrendProvider(groupId));`

Drop cached AsyncValue so the next watch refetches (after login or a mutation).

**L152.** `ref.invalidate(attendanceRangeProvider);`

Drop cached AsyncValue so the next watch refetches (after login or a mutation).

**L181.** `final groupId = ref.watch(activeGroupIdProvider);`

Rebuild this widget/provider when the dependency changes. Do not put watch in a click handler.

**L194.** `final members = ref.watch(groupMembersProvider(groupId));`

Rebuild this widget/provider when the dependency changes. Do not put watch in a click handler.

**L195.** `final saved = ref.watch(todayAttendanceProvider(groupId));`

Rebuild this widget/provider when the dependency changes. Do not put watch in a click handler.

**L476.** `class _TeacherAttendanceHistoryTab extends ConsumerWidget {`

Type definition. If this is a widget, find build(). If this is a repository, find the supabase calls.

**L513.** `final records = ref.watch(attendanceRangeProvider(query));`

Rebuild this widget/provider when the dependency changes. Do not put watch in a click handler.

**L514.** `final stats = ref.watch(attendanceRangeStatsProvider(query));`

Rebuild this widget/provider when the dependency changes. Do not put watch in a click handler.

**L594.** `class _BulkActions extends StatelessWidget {`

Type definition. If this is a widget, find build(). If this is a repository, find the supabase calls.

# SQL function atlas — every exported function

Each file under docs/tutorial/export/fn_*.sql is a live function body recovered from the MU Study database. Read the name, then the LANGUAGE and SECURITY clause, then the body. SECURITY DEFINER functions run as the owner — they must check is_admin() or membership themselves because RLS on tables they touch may be bypassed.

## fn__demo_insert_user.sql

Function family: **_demo_insert_user**. If the name starts with admin_, only an admin session should succeed. If it starts with trg_, it is a trigger helper. If it starts with is_ or can_, it is a boolean used inside RLS policies.

> **WARNING — SECURITY DEFINER**
> This function runs with the privileges of its owner. Confirm it checks auth.uid() / is_admin() / membership before writing rows. Never expose a definer that inserts into auth.users without an admin gate.

**fn__demo_insert_user.sql**

```
CREATE OR REPLACE FUNCTION public._demo_insert_user(p_username text, p_password text,
p_full_name text, p_role user_role)
 RETURNS uuid
 LANGUAGE plpgsql
 SECURITY DEFINER
 SET search_path TO 'public', 'auth', 'extensions'
AS $function$
DECLARE v_user_id UUID := gen_random_uuid(); v_email TEXT;
BEGIN
  v_email := lower(trim(replace(p_username, '@', ''))) || '@mustudy.internal';
  INSERT INTO auth.users (
    instance_id, id, aud, role, email, encrypted_password, email_confirmed_at,
    raw_app_meta_data, raw_user_meta_data, created_at, updated_at,
    confirmation_token, recovery_token, email_change_token_new, email_change,
    is_sso_user, is_anonymous
  ) VALUES (
    '00000000-0000-0000-0000-000000000000', v_user_id, 'authenticated', 'authenticated',
    v_email, extensions.crypt(p_password, extensions.gen_salt('bf')), NOW(),
    jsonb_build_object('provider','email','providers',ARRAY['email']),
    jsonb_build_object('username', p_username, 'full_name', p_full_name, 'role', p_role::text),
    NOW(), NOW(), '', '', '', '', false, false
  );
  INSERT INTO auth.identities (id, user_id, identity_data, provider, provider_id,
last_sign_in_at, created_at, updated_at)
  VALUES (
    gen_random_uuid(), v_user_id,
    jsonb_build_object('sub', v_user_id::text, 'email', v_email, 'email_verified', true),
    'email', v_email, NOW(), NOW(), NOW()
  );
  INSERT INTO public.profiles (id, username, full_name, role, auth_email)
  VALUES (v_user_id, trim(p_username), p_full_name, p_role, v_email);
  IF p_role = 'student' THEN INSERT INTO public.students (profile_id) VALUES (v_user_id); END
IF;
  RETURN v_user_id;
END; $function$
```

> **CHECKPOINT — Explain fn__demo_insert_user.sql**
> In one sentence: who may call this, what table it writes or reads, and what exception it raises on unauthorized use. If you cannot answer, re-read the first 20 lines of the body.

## fn_academic_semester_bounds.sql

Function family: **academic_semester_bounds**. If the name starts with admin_, only an admin session should succeed. If it starts with trg_, it is a trigger helper. If it starts with is_ or can_, it is a boolean used inside RLS policies.

**fn_academic_semester_bounds.sql**

```
CREATE OR REPLACE FUNCTION public.academic_semester_bounds(p_start_year integer, p_semester
integer)
 RETURNS TABLE(starts_on date, ends_on date)
 LANGUAGE plpgsql
 IMMUTABLE
AS $function$
BEGIN
  IF p_semester < 1 OR p_semester > 4 THEN
    RAISE EXCEPTION 'semester must be 1–4';
  END IF;

  RETURN QUERY
  SELECT
    CASE p_semester
      WHEN 1 THEN make_date(p_start_year, 8, 1)
      WHEN 2 THEN make_date(p_start_year, 11, 11)

# Annotated SQL — every statement in COMPLETE_BACKEND.sql

SQL is not decoration. Each statement either creates a type, a table, a view, a function, a trigger, or a grant. This chapter walks the complete script so you can narrate it without scrolling blindly.

## COMPLETE_BACKEND.sql lines 1–7

**COMPLETE_BACKEND.sql:1-7**

```
-- ============================================================
-- MU Study — Complete Backend Rebuild Script
-- Source: live Supabase project nmmdvdprczukaskxxdrs (EXACT)
-- Run in SQL Editor on a brand-new project, top to bottom.
-- ============================================================
```

Section comment in the recovered script. Use it as a bookmark when applying SQL.

> **CHECKPOINT — Explain lines 1–7**
> In one sentence: what object appears in Postgres after this chunk, and which Flutter file would break if you skipped it.

## COMPLETE_BACKEND.sql lines 8–11

**COMPLETE_BACKEND.sql:8-11**

```
CREATE EXTENSION IF NOT EXISTS pgcrypto WITH SCHEMA extensions;

-- ---------- ENUMS ----------
CREATE TYPE public.user_role AS ENUM ('student', 'teacher', 'admin');
```

Supporting SQL (constraint, comment, or continuation). Keep it when you recreate the database.

> **CHECKPOINT — Explain lines 8–11**
> In one sentence: what object appears in Postgres after this chunk, and which Flutter file would break if you skipped it.

## COMPLETE_BACKEND.sql lines 12–15

**COMPLETE_BACKEND.sql:12-15**

```
CREATE TYPE public.sphere_type AS ENUM ('math', 'english');
CREATE TYPE public.assignment_type AS ENUM ('static', 'homework_pack');
CREATE TYPE public.attendance_status AS ENUM ('present', 'absent', 'late', 'excused');
CREATE TYPE public.submission_status AS ENUM ('pending', 'submitted', 'reviewed');
```

Enum or composite type. Flutter models must use the same labels (homework_pack, not homeworkPack).

> **CHECKPOINT — Explain lines 12–15**
> In one sentence: what object appears in Postgres after this chunk, and which Flutter file would break if you skipped it.

## COMPLETE_BACKEND.sql lines 16–21

**COMPLETE_BACKEND.sql:16-21**

```
CREATE TYPE public.chat_message_type AS ENUM ('text', 'voice', 'image', 'video', 'file');
CREATE TYPE public.mark_category AS ENUM (
  'homework', 'classwork', 'quiz', 'test', 'exam', 'project', 'oral', 'other'
);

-- ---------- TABLES ----------
```

Enum or composite type. Flutter models must use the same labels (homework_pack, not homeworkPack).

> **CHECKPOINT — Explain lines 16–21**
> In one sentence: what object appears in Postgres after this chunk, and which Flutter file would break if you skipped it.

## COMPLETE_BACKEND.sql lines 22–43

**COMPLETE_BACKEND.sql:22-43**

```
CREATE TABLE public.profiles (
  id UUID PRIMARY KEY REFERENCES auth.users(id) ON DELETE CASCADE,

# Screen manual — every destination

A reconstruction is finished only when each screen exists, routes, and talks to the correct provider. Work this list with the running app.

## SplashScreen

| Field | Value |
|---|---|
| Route | /splash |
| File | lib/screens/auth/splash_screen.dart |
| Role gate | all |
| Purpose | Brand pause while session restores. |

Source length: 70 lines. Study build() first, then event handlers.

**lib/screens/auth/splash_screen.dart (opening)**

```
import 'package:flutter/material.dart';
import 'package:flutter/services.dart';
import 'package:flutter_animate/flutter_animate.dart';
import 'package:go_router/go_router.dart';
import 'package:mu_study/components/brand/app_logo.dart';
import 'package:mu_study/core/theme/app_colors.dart';

class SplashScreen extends StatefulWidget {
  const SplashScreen({super.key});

  @override
  State<SplashScreen> createState() => _SplashScreenState();
}

class _SplashScreenState extends State<SplashScreen> {
  @override
  void initState() {
    super.initState();
    Future<void>.delayed(const Duration(milliseconds: 1200), () {
      if (mounted) context.go('/boot');
    });
  }

  @override
  Widget build(BuildContext context) {
    final theme = Theme.of(context);
    final isDark = theme.brightness == Brightness.dark;
    final bg = theme.scaffoldBackgroundColor;
    final fg = isDark ? AppColors.darkTextPrimary : AppColors.darkChocolate;

    final overlay = isDark
        ? SystemUiOverlayStyle.light
        : SystemUiOverlayStyle.dark;

    return AnnotatedRegion<SystemUiOverlayStyle>(
      value: overlay.copyWith(
        statusBarColor: Colors.transparent,
        systemNavigationBarColor: bg,
        systemNavigationBarIconBrightness: isDark
            ? Brightness.light
            : Brightness.dark,
      ),
      child: Scaffold(
        backgroundColor: bg,
        body: Center(
          child: Column(
            mainAxisSize: MainAxisSize.min,
            children: [
              const AppLogoImage(size: 88)
                  .animate(onPlay: (c) => c.repeat(reverse: true))
```

```
                .scale(
                  begin: const Offset(0.95, 0.95),
                  end: const Offset(1.05, 1.05),
                  duration: 900.ms,
                ),
            const SizedBox(height: 16),
            Text(
              'MU Study',
              style: theme.textTheme.headlineMedium?.copyWith(
                fontWeight: FontWeight.w700,
                color: fg,
              ),
            ),
          ],
        ),
      ),
    ),
  );
 }
}
```

The opening shows imports — those are your dependency map. If you see auth_provider, the screen is session-aware. If you see l10n_x, strings are translated. If you see supabase_client directly, prefer moving that call into a provider when you rebuild.

1. Navigate to /splash as role all. If redirect sends you away, write which gate fired.
2. Name the provider(s) watched in build().
3. Perform the primary action (submit, save, send, create).
4. Confirm the Table Editor row or Storage object.
5. Repeat as a role that should be denied — you should bounce or see empty data.

> **TASK — Manual QA — SplashScreen**
> Screenshot /splash. Annotate one widget and the table behind it. File the screenshot in private notes.

# SetupRequiredScreen

| Field | Value |
|---|---|
| Route | (no route) |
| File | lib/screens/auth/setup_required_screen.dart |
| Role gate | misconfig |
| Purpose | Shown when Env.isConfigured is false. |

Source length: 81 lines. Study build() first, then event handlers.

**lib/screens/auth/setup_required_screen.dart (opening)**

```
import 'package:flutter/material.dart';

The opening shows imports — those are your dependency map. If you see auth_provider, the screen is session-aware. If you see l10n_x, strings are translated. If you see supabase_client directly, prefer moving that call into a provider when you rebuild.

1. Navigate to /student/notifications as role student. If redirect sends you away, write which gate fired.
2. Name the provider(s) watched in build().
3. Perform the primary action (submit, save, send, create).
4. Confirm the Table Editor row or Storage object.
5. Repeat as a role that should be denied — you should bounce or see empty data.

# Provider manual — every state module

## lib/providers/admin/admin_providers.dart

Users, groups, analytics, academic years, mass generator. This file (admin providers) is one concrete piece of that layer.

Providers declared: adminPlatformStatsProvider, adminGroupsProvider, adminAnnouncementsProvider, allProfilesProvider.

**lib/providers/admin/admin_providers.dart**

```
import 'dart:async';

import 'package:flutter_riverpod/flutter_riverpod.dart';
import 'package:supabase_flutter/supabase_flutter.dart';
import 'package:mu_study/core/paging/page_result.dart';
import 'package:mu_study/models/models.dart';
import 'package:mu_study/supabase/supabase_client.dart';

Future<int> _exactCount(String table) async {
  final result = await supabase
      .from(table)
      .select('id')
      .count(CountOption.exact);
  return result.count;
}

final adminPlatformStatsProvider = FutureProvider<Map<String, int>>((
  ref,
) async {
  final teachers = await _exactCount('teachers');
  final students = await _exactCount('students');
  final groups = await _exactCount('groups');
  final assignments = await _exactCount('assignments');
  final marks = await _exactCount('marks');
  return {
    'teachers': teachers,
    'students': students,
    'groups': groups,
    'assignments': assignments,
    'marks': marks,
  };
});

final adminGroupsProvider = FutureProvider<List<Map<String, dynamic>>>((
  ref,
) async {
