**TASK — Trace lib/providers/chat/chat_providers.dart**
Write the table/RPC list. Write which screen watches each provider. Write what invalidate you must call after a successful mutation.

## lib/providers/focus/focus_session_provider.dart

Local Pomodoro/free timer persisted in SharedPreferences. This file (focus session provider) is one concrete piece of that layer.

Providers declared: focusSessionProvider, focusChatMutedProvider.

**lib/providers/focus/focus_session_provider.dart**

> **CHECKPOINT — Closed lib/components/chat/chat_media_gallery.dart**
> Name the file's public API in one breath. If you cannot, reread the class/provider table in the annotated chapter.

# Every line — lib/components/decor/paper_decor.dart

Application source used by MU Study. Read the imports first, then the public types, then the widget build or provider body.

**L6** `class PaperAssets {`
Type definition. If this is a widget, find build(). If this is a repository, find the supabase calls.

**L7** `static const _dir = 'assets/images/nature-paper';`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L9** `static const avatarSilhouette = '$_dir/avatar-silhouette.png';`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L10** `static const beigeLeaf = '$_dir/beige-leaf.png';`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L11** `static const bookshelfSingle = '$_dir/bookshelf-single-shelf.png';`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L12** `static const bookshelfDouble = '$_dir/bookshelf-two-shelves.png';`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L13** `static const brainVerified = '$_dir/brain-verified.png';`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L14** `static const browserDashboard = '$_dir/browser-dashboard.png';`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L15** `static const calendar = '$_dir/calendar.png';`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L16** `static const calendarWithClock = '$_dir/calendar-with-clock.png';`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L17** `static const cardboardStar = '$_dir/cardboard-star.png';`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L18** `static const chatBubbles = '$_dir/chat-bubbles.png';`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L19** `static const clipboardChecklist = '$_dir/clipboard-checklist.png';`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L20** `static const clipboardProfile = '$_dir/clipboard-profile.png';`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L21** `static const clipboardWithPencil = '$_dir/clipboard-with-pencil.png';`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L22** `static const closeButton = '$_dir/close-button.png';`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L23** `static const creamBird = '$_dir/cream-bird.png';`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L24** `static const creamPaperGreenTape = '$_dir/cream-paper-green-tape.png';`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L25** `static const divisionButton = '$_dir/division-button.png';`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L26** `static const documentLayout = '$_dir/document-layout.png';`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L27** `static const downloadInbox = '$_dir/download-inbox.png';`
Storage read. Private buckets need a signed URL; avatars may use getPublicUrl.

**L28** `static const dustyRoseFlower = '$_dir/dusty-rose-flower.png';`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L29** `static const envelopeSuccess = '$_dir/envelope-success.png';`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L30** `static const flatCloud = '$_dir/flat-cloud.png';`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L31** `static const grayCloud = '$_dir/gray-cloud.png';`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L32** `static const groupChat = '$_dir/group-chat.png';`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L33** `static const hangingGarland = '$_dir/hanging-garland.png';`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L34** `static const homeHouse = '$_dir/home-house.png';`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L35** `static const kraftPaperStrip = '$_dir/kraft-paper-strip.png';`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L36** `static const landscapeHills = '$_dir/landscape-hills-footer.png';`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L37** `static const linedPaperPencil = '$_dir/lined-paper-pencil.png';`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L38** `static const magnifyingGlass = '$_dir/magnifying-glass.png';`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L39** `static const manilaFolder = '$_dir/manila-folder.png';`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L40** `static const marketStall = '$_dir/market-stall.png';`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L41** `static const minusButton = '$_dir/minus-button.png';`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L42** `static const notificationBell = '$_dir/notification-bell-alert.png';`

> **CHECKPOINT — Closed lib/components/inputs/load_more_button.dart**
> Name the file’s public API in one breath. If you cannot, reread the class/provider table in the annotated chapter.

# Every line — lib/components/layouts/app_shell.dart

Application source used by MU Study. Read the imports first, then the public types, then the widget build or provider body.

**L20** `class AppShell extends ConsumerStatefulWidget {`
Type definition. If this is a widget, find build(). If this is a repository, find the supabase calls.

**L21** `const AppShell({`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L22** `super.key,`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L23** `required this.role,`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L24** `required this.child,`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L25** `required this.destinations,`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L28** `final UserRole role;`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L29** `final Widget child;`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L30** `final List<ShellDestination> destinations;`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L32** `@override`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L33** `ConsumerState<AppShell> createState() => _AppShellState();`
Widget that can watch providers. Required for profile/theme/locale.

**L36** `class _AppShellState extends ConsumerState<AppShell> {`
Type definition. If this is a widget, find build(). If this is a repository, find the supabase calls.

**L37** `bool _isSidebarExpanded = true;`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L39** `int _indexFromLocation(String location) {`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L40** `for (var i = 0; i < widget.destinations.length; i++) {`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L41** `if (location.startsWith(widget.destinations[i].path)) return i;`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L43** `return 0;`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L46** `void _go(int index) {`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L47** `context.go(widget.destinations[index].path);`
Replace the navigation stack location. Login uses /boot so redirect can settle.

**L50** `@override`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L51** `Widget build(BuildContext context) {`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L52** `final location = GoRouterState.of(context).uri.toString();`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L53** `final index = _indexFromLocation(location);`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L54** `final unreadNotifications = ref.watch(unreadNotificationsCountProvider);`
Rebuild this widget/provider when the dependency changes. Do not put watch in a click handler.

**L55** `final unreadChat = ref.watch(focusChatMutedProvider)`
Rebuild this widget/provider when the dependency changes. Do not put watch in a click handler.

**L56** `? 0`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L57** `: ref.watch(unreadChatCountProvider);`
Rebuild this widget/provider when the dependency changes. Do not put watch in a click handler.

**L58** `final isDesktop = MediaQuery.sizeOf(context).width >= Breakpoints.desktop;`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L59** `final isTablet = context.isTablet;`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L60** `final l10n = context.l10n;`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L61** `String labelOf(ShellDestination d) => navLabel(l10n, d.labelKey);`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L63** `int badgeCount(ShellDestination d) => switch (d.badge) {`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L64** `ShellBadgeKind.notifications => unreadNotifications,`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L65** `ShellBadgeKind.chat => unreadChat,`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L66** `ShellBadgeKind.none => 0,`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L67** `};`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L69** `Widget icon(`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L70** `ShellDestination d, {`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L71** `bool isSelected = false,`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L72** `bool usePaperAssets = true,`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L73** `}) {`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L74** `final isMono =`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L75** `AppStyleTokens.maybeOf(context)?.isMonochromeWorkspace ?? false;`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L76** `final tone = isSelected`

Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L77** `? AppColors.accent(context)`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L78** `: AppColors.inkAlpha(context, 0.5);`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

# Every line — lib/core/homework/feedback_reuse.dart

Due-date helpers and assignment template JSON. This file (feedback reuse) is one concrete piece of that layer.

**L6** `const _snippetsPrefsKey = 'teacher_feedback_snippets';`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L7** `const _maxSnippets = 20;`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L9** `Future<List<String>> loadFeedbackSnippets({required String teacherId}) async {`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L10** `final prefs = await SharedPreferences.getInstance();`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L11** `final local = _readLocal(prefs, teacherId);`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L13** `final remote = await _fetchRecentFeedbackFromDb(teacherId);`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L14** `return _mergeUnique(local, remote);`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L17** `Future<void> rememberFeedbackSnippet({`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L18** `required String teacherId,`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L19** `required String feedback,`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L20** `}) async {`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L21** `final text = feedback.trim();`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L22** `if (text.isEmpty) return;`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L24** `final prefs = await SharedPreferences.getInstance();`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L25** `final current = _readLocal(prefs, teacherId);`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L26** `final next = _mergeUnique([text], current).take(_maxSnippets).toList();`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L28** `final all = _readAll(prefs);`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L29** `all[teacherId] = next;`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L30** `await prefs.setString(_snippetsPrefsKey, jsonEncode(all));`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L33** `Future<int> applyFeedbackToOtherPendingForSameTask({`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L34** `required String submissionId,`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L35** `required String feedback,`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L36** `}) async {`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L37** `final text = feedback.trim();`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L38** `if (text.isEmpty) return 0;`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L40** `final row = await supabase`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L41** `.from('submissions')`
PostgREST table access. RLS still applies. The string is the Postgres table or view name.

**L42** `.select('task_id')`
Read columns. Narrow the select when the row is wide; '*' is acceptable for small domain rows.

**L43** `.eq('id', submissionId)`
Equality filter. This is the WHERE clause. Wrong UUID type (profile vs student id) yields empty lists.

**L44** `.maybeSingle();`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L45** `final taskId = row?['task_id'] as String?;`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L46** `if (taskId == null) return 0;`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L48** `final siblings = await supabase`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L49** `.from('submissions')`
PostgREST table access. RLS still applies. The string is the Postgres table or view name.

**L50** `.select('id')`
Read columns. Narrow the select when the row is wide; '*' is acceptable for small domain rows.

**L51** `.eq('task_id', taskId)`
Equality filter. This is the WHERE clause. Wrong UUID type (profile vs student id) yields empty lists.

**L52** `.neq('id', submissionId)`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L53** `.inFilter('status', ['pending', 'submitted']);`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L55** `if (siblings.isEmpty) return 0;`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L57** `final ids = siblings.map((e) => e['id'] as String).toList();`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L58** `await supabase`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L59** `.from('submissions')`
PostgREST table access. RLS still applies. The string is the Postgres table or view name.

**L60** `.update({'feedback': text})`
Mutates matching rows. Silent zero rows usually means SELECT policy is missing for UPDATE.

**L61** `.inFilter('id', ids);`

Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L62** `return ids.length;`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L65** `Future<List<String>> _fetchRecentFeedbackFromDb(String teacherId) async {`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L66** `final assignments = await supabase`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L67** `.from('assignments')`
PostgREST table access. RLS still applies. The string is the Postgres table or view name.

**L68** `.select('id')`
Read columns. Narrow the select when the row is wide; '*' is acceptable for small domain rows.

**L69** `.eq('teacher_id', teacherId);`
Equality filter. This is the WHERE clause. Wrong UUID type (profile vs student id) yields empty lists.

**L70** `final assignmentIds = assignments.map((e) => e['id'] as String).toList();`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L71** `if (assignmentIds.isEmpty) return const [];`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L73** `final tasks = await supabase`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L74** `.from('tasks')`
PostgREST table access. RLS still applies. The string is the Postgres table or view name.

**L75** `.select('id')`
Read columns. Narrow the select when the row is wide; '*' is acceptable for small domain rows.

**L76** `.inFilter('assignment_id', assignmentIds);`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L77** `final taskIds = tasks.map((e) => e['id'] as String).toList();`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L42** `downloadFallbackEnabled: true,`
Storage read. Private buckets need a signed URL; avatars may use getPublicUrl.

**L43** `),`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

> **CHECKPOINT — Closed lib/core/progress/progress_report_share.dart**
> Name the file’s public API in one breath. If you cannot, reread the class/provider table in the annotated chapter.

# Every line — lib/core/router/app_router.dart

go_router route table and auth/language/disabled redirects. This file (app router) is one concrete piece of that layer.

**L43** `final routerProvider = Provider<GoRouter>((ref) {`
Riverpod binding. Name it after the value it exposes.

**L44** `final notifier = _RouterNotifier(ref);`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L46** `return GoRouter(`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L47** `initialLocation: '/splash',`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L48** `refreshListenable: notifier,`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L49** `redirect: notifier.redirect,`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L50** `routes: [`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L51** `GoRoute(path: '/splash', builder: (_, _) => const SplashScreen()),`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L52** `GoRoute(path: '/login', builder: (_, _) => const LoginScreen()),`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L53** `GoRoute(`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L54** `path: '/language',`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L55** `builder: (_, _) => const LanguageSelectionScreen(),`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L56** `),`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L57** `GoRoute(`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L58** `path: '/boot',`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L59** `builder: (_, _) =>`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L60** `const Scaffold(body: Center(child: CircularProgressIndicator())),`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L61** `),`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L62** `GoRoute(`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L63** `path: '/account-disabled',`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L64** `builder: (context, _) =>`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L65** `Scaffold(body: Center(child: Text(context.l10n.accountDisabled))),`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L66** `),`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L67** `_studentShell(),`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L68** `_teacherShell(),`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L69** `_adminShell(),`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L74** `class _RouterNotifier extends ChangeNotifier {`
Type definition. If this is a widget, find build(). If this is a repository, find the supabase calls.

**L75** `_RouterNotifier(this._ref) {`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L76** `_ref.listen(authStateProvider, (_, _) => notifyListeners());`
Riverpod binding. Name it after the value it exposes.

**L77** `_ref.listen(currentProfileProvider, (_, _) => notifyListeners());`
Riverpod binding. Name it after the value it exposes.

**L80** `final Ref _ref;`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L82** `String? redirect(BuildContext context, GoRouterState state) {`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L83** `final loc = state.matchedLocation;`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L84** `if (loc == '/splash') return null;`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L86** `final session = Supabase.instance.client.auth.currentSession;`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L87** `if (session == null) {`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L88** `return loc == '/login' ? null : '/login';`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L91** `final profileAsync = _ref.read(currentProfileProvider);`
One-shot access, typical in onPressed. Login uses read(authRepositoryProvider).

**L96** `if (!profileAsync.hasValue &&`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L97** `(profileAsync.isLoading || profileAsync.isRefreshing)) {`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L98** `if (loc == '/boot' || loc == '/language') return null;`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L99** `return '/boot';`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L102** `final profile = profileAsync.valueOrNull;`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L103** `if (profile == null) {`

Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L104** `return loc == '/login' ? null : '/login';`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L106** `if (profile.isDisabled) {`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L107** `return loc == '/account-disabled' ? null : '/account-disabled';`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L110** `final home = switch (profile.role) {`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L111** `UserRole.student => '/student/dashboard',`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L112** `UserRole.teacher => '/teacher/dashboard',`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L113** `UserRole.admin => '/admin/dashboard',`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L114** `};`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L116** `if (!profile.hasChosenLanguage) {`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L117** `return loc == '/language' ? null : '/language';`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L120** `if (loc == '/login' || loc == '/boot' || loc == '/language') {`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L121** `return home;`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L124** `return null;`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**CHECKPOINT — Closed lib/core/theme/nature_paper_theme.dart**
Name the file’s public API in one breath. If you cannot, reread the class/provider table in the annotated chapter.

# Every line — lib/core/theme/neumorphic.dart

Four visual styles × light/dark Material 3 themes. This file (neumorphic) is one concrete piece of that layer.

**L8** `enum NeuElevation { flat, raised, floating, pressed }`
Closed set of values. Keep it aligned with the Postgres enum or the fromString helper.

**L10** `class Neumorphic {`
Type definition. If this is a widget, find build(). If this is a repository, find the supabase calls.

**L11** `const Neumorphic._();`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L13** `static bool isActive(BuildContext context) =>`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L706** `'media_url': null,`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L707** `}).inFilter('id', ids);`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L710** `Future<void> toggleReaction(String messageId, String emoji) async {`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L711** `final profile = await ref.read(currentProfileProvider.future);`
One-shot access, typical in onPressed. Login uses read(authRepositoryProvider).

**L712** `if (profile == null) throw StateError('Not signed in');`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L714** `final current = state.valueOrNull;`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L715** `ChatMessage? message;`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L716** `if (current != null) {`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L717** `for (final m in current.messages) {`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L718** `if (m.id == messageId) {`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L719** `message = m;`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L720** `break;`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L724** `final existing = message?.myReactionEmoji(profile.id);`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L726** `if (current != null && message != null) {`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L727** `final nextReactions = <ChatReaction>[`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L728** `for (final r in message.reactions)`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L729** `if (r.userId != profile.id) r,`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L731** `if (existing != emoji) {`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L732** `nextReactions.add(`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L733** `ChatReaction(`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L734** `id: 'local-${profile.id}',`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L735** `messageId: messageId,`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L736** `userId: profile.id,`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L737** `emoji: emoji,`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L738** `),`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L741** `state = AsyncData(`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L742** `current.copyWith(`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L743** `messages: [`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L744** `for (final m in current.messages)`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L745** `if (m.id == messageId)`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L746** `m.copyWith(reactions: nextReactions)`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L747** `else`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L748** `m,`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L750** `),`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L754** `await supabase.rpc(`
Remote procedure call. Authorization and writes that are too complex for a single RLS policy often live here (login email, admin create user, unread counts).

**L755** `'toggle_message_reaction',`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L756** `params: {'p_message_id': messageId, 'p_emoji': emoji},`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L760** `Future<void> markRoomRead() async {`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L761** `final profile = await ref.read(currentProfileProvider.future);`
One-shot access, typical in onPressed. Login uses read(authRepositoryProvider).

**L762** `if (profile == null) return;`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L764** `final unread = await supabase`

Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L765** `.from('chat_messages')`
PostgREST table access. RLS still applies. The string is the Postgres table or view name.

**L766** `.select('id')`
Read columns. Narrow the select when the row is wide; '*' is acceptable for small domain rows.

**L767** `.eq('room_id', arg)`
Equality filter. This is the WHERE clause. Wrong UUID type (profile vs student id) yields empty lists.

**L768** `.eq('is_deleted', false)`
Equality filter. This is the WHERE clause. Wrong UUID type (profile vs student id) yields empty lists.

**L769** `.neq('sender_id', profile.id);`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L771** `final ids = (unread as List)`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L772** `.map((e) => (e as Map)['id'] as String)`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L773** `.toList();`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L774** `if (ids.isEmpty) return;`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L776** `final existing = await supabase`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L777** `.from('message_reads')`
PostgREST table access. RLS still applies. The string is the Postgres table or view name.

**L778** `.select('message_id')`
Read columns. Narrow the select when the row is wide; '*' is acceptable for small domain rows.

**L779** `.eq('user_id', profile.id)`
Equality filter. This is the WHERE clause. Wrong UUID type (profile vs student id) yields empty lists.

**L780** `.inFilter('message_id', ids);`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L781** `final already = {`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L782** `for (final e in existing as List) (e as Map)['message_id'] as String,`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L783** `};`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L784** `final toInsert = ids`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L785** `.where((id) => !already.contains(id))`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L786** `.map((id) => {'message_id': id, 'user_id': profile.id})`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L787** `.toList();`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L788** `if (toInsert.isEmpty) return;`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L790** `await supabase`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L791** `.from('message_reads')`
PostgREST table access. RLS still applies. The string is the Postgres table or view name.

**L792** `.upsert(toInsert, onConflict: 'message_id,user_id');`
Insert-or-update. Submissions and attendance use this so retrying is safe.

**L793** `ref.invalidate(chatRoomsProvider);`
Drop cached AsyncValue so the next watch refetches (after login or a mutation).

**L797** `final chatMessagesProvider =`
Riverpod binding. Name it after the value it exposes.

**L798** `AsyncNotifierProvider.family<`
Riverpod binding. Name it after the value it exposes.

**L799** `ChatMessagesNotifier,`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L800** `ChatMessagesState,`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L801** `String`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L802** `>(ChatMessagesNotifier.new);`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

> **CHECKPOINT — Closed lib/providers/chat/chat_providers.dart**
> Name the file’s public API in one breath. If you cannot, reread the class/provider table in the annotated chapter.

# Every line — lib/providers/focus/focus_session_provider.dart

Local Pomodoro/free timer persisted in SharedPreferences. This file (focus session provider) is one concrete piece of that layer.

**L8** `const _prefsKey = 'focus_session_v1';`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L10** `enum FocusTimerMode { pomodoro, free }`
Closed set of values. Keep it aligned with the Postgres enum or the fromString helper.

**L12** `const kFocusPomodoroDuration = Duration(minutes: 25);`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L14** `class FocusSession {`
Type definition. If this is a widget, find build(). If this is a repository, find the supabase calls.

**L15** `const FocusSession({`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L16** `required this.assignmentId,`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L17** `required this.assignmentTitle,`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L18** `required this.mode,`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L19** `required this.startedAt,`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L20** `this.accumulated = Duration.zero,`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L21** `this.pausedAt,`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L24** `final String assignmentId;`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L25** `final String assignmentTitle;`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L26** `final FocusTimerMode mode;`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L27** `final DateTime startedAt;`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L29** `final Duration accumulated;`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L30** `final DateTime? pausedAt;`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L32** `bool get isPaused => pausedAt != null;`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L34** `Duration elapsedAt([DateTime? now]) {`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L35** `final n = now ?? DateTime.now();`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L36** `if (isPaused) return accumulated;`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L37** `return accumulated + n.difference(startedAt);`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L40** `Duration? remainingAt([DateTime? now]) {`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L41** `if (mode != FocusTimerMode.pomodoro) return null;`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L42** `final left = kFocusPomodoroDuration - elapsedAt(now);`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L43** `return left.isNegative ? Duration.zero : left;`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L46** `bool isCompleteAt([DateTime? now]) {`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L47** `final left = remainingAt(now);`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L48** `return left != null && left == Duration.zero;`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

# Every line — lib/providers/groups/group_providers.dart

Teacher-owned and student-membership groups. This file (group providers) is one concrete piece of that layer.

**L6** `final myGroupsProvider = FutureProvider<List<StudyGroup>>((ref) async {`
Riverpod binding. Name it after the value it exposes.

**L7** `final profile = await ref.watch(currentProfileProvider.future);`
Rebuild this widget/provider when the dependency changes. Do not put watch in a click handler.

**L8** `if (profile == null) return [];`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L10** `if (profile.role == UserRole.teacher) {`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L11** `final teacher = await ref.watch(teacherProfileProvider.future);`
Rebuild this widget/provider when the dependency changes. Do not put watch in a click handler.

**L12** `if (teacher == null) return [];`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L13** `final rows = await supabase`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L14** `.from('groups')`
PostgREST table access. RLS still applies. The string is the Postgres table or view name.

**L15** `.select()`
Read columns. Narrow the select when the row is wide; '*' is acceptable for small domain rows.

**L16** `.eq('teacher_id', teacher.id)`
Equality filter. This is the WHERE clause. Wrong UUID type (profile vs student id) yields empty lists.

**L17** `.order('title');`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L18** `return rows`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L19** `.map((e) => StudyGroup.fromJson(Map<String, dynamic>.from(e)))`
PostgREST table access. RLS still applies. The string is the Postgres table or view name.

**L20** `.toList();`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L23** `if (profile.role == UserRole.student) {`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L24** `final student = await ref.watch(studentProfileProvider.future);`
Rebuild this widget/provider when the dependency changes. Do not put watch in a click handler.

**L25** `if (student == null) return [];`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L26** `final rows = await supabase`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L27** `.from('group_students')`
PostgREST table access. RLS still applies. The string is the Postgres table or view name.

**L28** `.select('groups(*)')`
Read columns. Narrow the select when the row is wide; '*' is acceptable for small domain rows.

**L29** `.eq('student_id', student.id);`
Equality filter. This is the WHERE clause. Wrong UUID type (profile vs student id) yields empty lists.

**L30** `return rows`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L31** `.map(`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L32** `(e) => StudyGroup.fromJson(`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L33** `Map<String, dynamic>.from(e['groups'] as Map),`
PostgREST table access. RLS still applies. The string is the Postgres table or view name.

**L34** `),`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L36** `.toList();`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L39** `final rows = await supabase.from('groups').select().order('title');`
PostgREST table access. RLS still applies. The string is the Postgres table or view name.

**L40** `return rows`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L41** `.map((e) => StudyGroup.fromJson(Map<String, dynamic>.from(e)))`
PostgREST table access. RLS still applies. The string is the Postgres table or view name.

**L42** `.toList();`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L45** `final selectedGroupIdProvider = StateProvider<String?>((ref) => null);`
Riverpod binding. Name it after the value it exposes.

**L47** `final activeGroupIdProvider = Provider<String?>((ref) {`
Riverpod binding. Name it after the value it exposes.

**L48** `final selected = ref.watch(selectedGroupIdProvider);`
Rebuild this widget/provider when the dependency changes. Do not put watch in a click handler.

**L49** `final groups = ref.watch(myGroupsProvider).valueOrNull ?? const [];`
Rebuild this widget/provider when the dependency changes. Do not put watch in a click handler.

**L27** `.limit(50);`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L28** `final list = rows.map((e) => Map<String, dynamic>.from(e)).toList();`
PostgREST table access. RLS still applies. The string is the Postgres table or view name.

**L29** `await cache?.cacheNotifications(list);`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L30** `return list.map(AppNotification.fromJson).toList();`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L33** `final changes = StreamController<void>();`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L34** `final channel = supabase`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L35** `.channel('notifications-${profile.id}')`
Realtime subscription. Dispose the channel on provider dispose or you leak events across logins.

**L36** `.onPostgresChanges(`

Realtime subscription. Dispose the channel on provider dispose or you leak events across logins.

**L37** `event: PostgresChangeEvent.all,`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L38** `schema: 'public',`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L39** `table: 'notifications',`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L40** `filter: PostgresChangeFilter(`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L41** `type: PostgresChangeFilterType.eq,`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L42** `column: 'user_id',`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L43** `value: profile.id,`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L44** `),`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L45** `callback: (_) {`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L46** `if (!changes.isClosed) changes.add(null);`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L47** `},`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L49** `.subscribe();`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L51** `ref.onDispose(() {`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L52** `supabase.removeChannel(channel);`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L53** `changes.close();`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L56** `yield await load();`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L58** `await for (final _ in changes.stream) {`
