Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L59** `yield await load();`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L63** `final unreadNotificationsCountProvider = Provider<int>((ref) {`
Riverpod binding. Name it after the value it exposes.

**L64** `final notifications = ref.watch(notificationsProvider);`
Rebuild this widget/provider when the dependency changes. Do not put watch in a click handler.

**L65** `return notifications.maybeWhen(`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L66** `data: (list) => list.where((n) => !n.isRead).length,`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L67** `orElse: () => 0,`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L71** `final announcementsProvider =`
Riverpod binding. Name it after the value it exposes.

**L72** `FutureProvider.family<List<Announcement>, String?>((ref, groupId) async {`
Riverpod binding. Name it after the value it exposes.

**L73** `var query = supabase.from('announcements').select();`
PostgREST table access. RLS still applies. The string is the Postgres table or view name.

**L74** `if (groupId != null) query = query.eq('group_id', groupId);`
Equality filter. This is the WHERE clause. Wrong UUID type (profile vs student id) yields empty lists.

**L75** `final rows = await query.order('created_at', ascending: false);`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L76** `return rows`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L77** `.map((e) => Announcement.fromJson(Map<String, dynamic>.from(e)))`
PostgREST table access. RLS still applies. The string is the Postgres table or view name.

**L78** `.toList();`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L81** `Future<void> markNotificationRead(String id) async {`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L82** `await supabase.from('notifications').update({'is_read': true}).eq('id', id);`
PostgREST table access. RLS still applies. The string is the Postgres table or view name.

**L85** `Future<void> markAllNotificationsRead(String userId) async {`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L86** `await supabase`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L87** `.from('notifications')`
PostgREST table access. RLS still applies. The string is the Postgres table or view name.

**L88** `.update({'is_read': true})`
Mutates matching rows. Silent zero rows usually means SELECT policy is missing for UPDATE.

**L89** `.eq('user_id', userId)`
Equality filter. This is the WHERE clause. Wrong UUID type (profile vs student id) yields empty lists.

**L90** `.eq('is_read', false);`
Equality filter. This is the WHERE clause. Wrong UUID type (profile vs student id) yields empty lists.

> **CHECKPOINT — Closed lib/screens/admin/announcements/admin_announcements_screen.dart**
> Name the file's public API in one breath. If you cannot, reread the class/provider table in the annotated chapter.

# Every line — lib/screens/admin/credentials/admin_credential_print_screen.dart

Application source used by MU Study. Read the imports first, then the public types, then the widget build or provider body.

**L14** `class AdminCredentialPrintScreen extends ConsumerStatefulWidget {`
Type definition. If this is a widget, find build(). If this is a repository, find the supabase calls.

**L15** `const AdminCredentialPrintScreen({super.key});`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L17** `@override`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L18** `ConsumerState<AdminCredentialPrintScreen> createState() =>`
Widget that can watch providers. Required for profile/theme/locale.

**L19** `_AdminCredentialPrintScreenState();`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L22** `class _AdminCredentialPrintScreenState`
Type definition. If this is a widget, find build(). If this is a repository, find the supabase calls.

**L23** `extends ConsumerState<AdminCredentialPrintScreen> {`
Widget that can watch providers. Required for profile/theme/locale.

**L24** `UserRole _role = UserRole.student;`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L25** `String? _groupId;`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L26** `bool _exporting = false;`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L28** `Future<void> _export() async {`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L29** `if (_exporting) return;`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L30** `setState(() => _exporting = true);`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**CHECKPOINT — Closed**
**lib/screens/admin/data_generator/admin_mass_data_generator_screen.dart**
Name the file’s public API in one breath. If you cannot, reread the class/provider table in the annotated chapter.

# Every line — lib/screens/admin/groups/admin_groups_screen.dart

Application source used by MU Study. Read the imports first, then the public types, then the widget build or provider body.

**L13** `class AdminGroupsScreen extends ConsumerStatefulWidget {`
Type definition. If this is a widget, find build(). If this is a repository, find the supabase calls.

**L14** `const AdminGroupsScreen({super.key});`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L16** `@override`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L17** `ConsumerState<AdminGroupsScreen> createState() => _AdminGroupsScreenState();`
Widget that can watch providers. Required for profile/theme/locale.

**L20** `class _AdminGroupsScreenState extends ConsumerState<AdminGroupsScreen> {`
Type definition. If this is a widget, find build(). If this is a repository, find the supabase calls.

**L21** `Future<void> _createGroup() async {`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L22** `final title = TextEditingController();`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L23** `String? selectedTeacherId;`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L24** `var submitting = false;`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L26** `final teachersRes = await supabase`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L27** `.from('teachers')`
PostgREST table access. RLS still applies. The string is the Postgres table or view name.

**L28** `.select('id, profiles(full_name, username)');`
Read columns. Narrow the select when the row is wide; '*' is acceptable for small domain rows.

**L29** `final teachers = teachersRes as List<dynamic>;`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L31** `if (!mounted) return;`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L33** `await showDialog<void>(`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L140** `final studentRes = await supabase`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L141** `.from('students')`
PostgREST table access. RLS still applies. The string is the Postgres table or view name.

**L142** `.select('id')`
Read columns. Narrow the select when the row is wide; '*' is acceptable for small domain rows.

**L143** `.eq('profile_id', userId)`
Equality filter. This is the WHERE clause. Wrong UUID type (profile vs student id) yields empty lists.

**L144** `.single();`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L145** `final studentId = studentRes['id'] as String;`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L147** `await supabase.from('group_students').insert({`
PostgREST table access. RLS still applies. The string is the Postgres table or view name.

**L148** `'group_id': selectedGroupId,`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L149** `'student_id': studentId,`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L153** `await saveLoginPassword(`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L154** `userId: '$userId',`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L155** `password: password.text,`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L158** `if (ctx.mounted) Navigator.pop(ctx);`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L159** `ref.invalidate(allProfilesProvider);`
Drop cached AsyncValue so the next watch refetches (after login or a mutation).

**L160** `if (mounted) {`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L161** `ScaffoldMessenger.of(context).showSnackBar(`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L162** `SnackBar(content: Text(l10n.adminUserCreated)),`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L205** `'p_user_id': profile.id,`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L206** `'p_password': password.text,`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L207** `},`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L209** `await saveLoginPassword(`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L210** `userId: profile.id,`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L211** `password: password.text,`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L213** `if (ctx.mounted) Navigator.pop(ctx);`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L214** `},`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L215** `child: Text(l10n.commonReset),`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L216** `),`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L219** `},`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L223** `Future<void> _toggleDisable(Profile profile) async {`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L224** `await supabase`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L225** `.from('profiles')`
PostgREST table access. RLS still applies. The string is the Postgres table or view name.

**L226** `.update({'is_disabled': !profile.isDisabled})`
Mutates matching rows. Silent zero rows usually means SELECT policy is missing for UPDATE.

**L227** `.eq('id', profile.id);`
Equality filter. This is the WHERE clause. Wrong UUID type (profile vs student id) yields empty lists.

**L228** `ref.invalidate(allProfilesProvider);`
Drop cached AsyncValue so the next watch refetches (after login or a mutation).

**L231** `@override`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L232** `Widget build(BuildContext context) {`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L233** `final profiles = ref.watch(allProfilesProvider);`

Rebuild this widget/provider when the dependency changes. Do not put watch in a click handler.

**L234** `final l10n = context.l10n;`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L236** `return Scaffold(`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L237** `appBar: AppBar(title: Text(l10n.adminUsers)),`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**CHECKPOINT — Closed lib/screens/admin/users/admin_users_screen.dart**
Name the file's public API in one breath. If you cannot, reread the class/provider table in the annotated chapter.

# Every line — lib/screens/auth/language_selection_screen.dart

Splash, login, language, setup-required, disabled account. This file (language selection screen) is one concrete piece of that layer.

**L10** `class LanguageSelectionScreen extends ConsumerStatefulWidget {`
Type definition. If this is a widget, find build(). If this is a repository, find the supabase calls.

**L11** `const LanguageSelectionScreen({super.key});`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L13** `@override`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L14** `ConsumerState<LanguageSelectionScreen> createState() =>`
Widget that can watch providers. Required for profile/theme/locale.

**L15** `_LanguageSelectionScreenState();`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L18** `class _LanguageSelectionScreenState`
Type definition. If this is a widget, find build(). If this is a repository, find the supabase calls.

**L19** `extends ConsumerState<LanguageSelectionScreen> {`
Widget that can watch providers. Required for profile/theme/locale.

**L20** `AppLanguage? _selected;`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L21** `bool _saving = false;`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L23** `@override`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L24** `void initState() {`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L25** `super.initState();`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L26** `WidgetsBinding.instance.addPostFrameCallback((_) {`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L27** `if (!mounted) return;`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L28** `setState(() {`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L29** `_selected = AppLanguage.fromLocale(ref.read(localeProvider));`
One-shot access, typical in onPressed. Login uses read(authRepositoryProvider).

**L34** `Future<void> _continue() async {`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L35** `final lang = _selected;`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L36** `if (lang == null || _saving) return;`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L38** `setState(() => _saving = true);`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L39** `try {`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L40** `await ref.read(localeProvider.notifier).setLanguage(lang);`
One-shot access, typical in onPressed. Login uses read(authRepositoryProvider).

**L41** `if (!mounted) return;`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L42** `context.go('/boot');`
Replace the navigation stack location. Login uses /boot so redirect can settle.

**L43** `} finally {`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L44** `if (mounted) setState(() => _saving = false);`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L48** `@override`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L49** `Widget build(BuildContext context) {`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L50** `final l10n = context.l10n;`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L51** `final profile = ref.watch(currentProfileProvider).valueOrNull;`
Rebuild this widget/provider when the dependency changes. Do not put watch in a click handler.

**L53** `return Scaffold(`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

> **CHECKPOINT — Closed lib/screens/auth/language_selection_screen.dart**
> Name the file’s public API in one breath. If you cannot, reread the class/provider table in the annotated chapter.

# Every line — lib/screens/auth/login_screen.dart

Splash, login, language, setup-required, disabled account. This file (login screen) is one concrete piece of that layer.

**L16** `class LoginScreen extends ConsumerStatefulWidget {`
Type definition. If this is a widget, find build(). If this is a repository, find the supabase calls.

**L17** `const LoginScreen({super.key});`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L19** `@override`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L20** `ConsumerState<LoginScreen> createState() => _LoginScreenState();`
Widget that can watch providers. Required for profile/theme/locale.

**L23** `class _LoginScreenState extends ConsumerState<LoginScreen> {`
Type definition. If this is a widget, find build(). If this is a repository, find the supabase calls.

**L24** `final _usernameController = TextEditingController();`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L25** `final _passwordController = TextEditingController();`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L26** `bool _loading = false;`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L27** `String? _error;`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L29** `@override`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L30** `void dispose() {`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L31** `_usernameController.dispose();`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L32** `_passwordController.dispose();`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L33** `super.dispose();`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L36** `Future<void> _login() async {`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L37** `final l10n = context.l10n;`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L38** `if (_usernameController.text.isEmpty || _passwordController.text.isEmpty) {`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L39** `setState(() => _error = l10n.loginMissingFields);`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

> **CHECKPOINT — Closed lib/screens/auth/splash_screen.dart**
> Name the file’s public API in one breath. If you cannot, reread the class/provider table in the annotated chapter.

# Every line — lib/screens/chat/list/chat_list_screen.dart

Application source used by MU Study. Read the imports first, then the public types, then the widget build or provider body.

**L17** `class ChatListScreen extends ConsumerStatefulWidget {`
Type definition. If this is a widget, find build(). If this is a repository, find the supabase calls.

**L18** `const ChatListScreen({super.key, required this.basePath});`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L20** `final String basePath;`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L22** `@override`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L23** `ConsumerState<ChatListScreen> createState() => _ChatListScreenState();`
Widget that can watch providers. Required for profile/theme/locale.

**L26** `class _ChatListScreenState extends ConsumerState<ChatListScreen> {`
Type definition. If this is a widget, find build(). If this is a repository, find the supabase calls.

**L27** `final _search = TextEditingController();`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L28** `String _query = '';`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L30** `@override`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L31** `void dispose() {`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L32** `_search.dispose();`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L33** `super.dispose();`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L36** `String _preview(ChatRoomSummary room, AppLocalizations l10n) {`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L37** `if (room.lastMessageId == null) return l10n.chatNoMessagesYet;`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L38** `if (room.lastMessageDeleted) return l10n.chatMessageDeleted;`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L39** `return switch (room.lastMessageType) {`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L40** `ChatMessageType.image => l10n.chatPreviewImage,`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L41** `ChatMessageType.video => l10n.chatPreviewVideo,`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L42** `ChatMessageType.voice => l10n.chatPreviewVoice,`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L43** `ChatMessageType.file =>`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L44** `room.lastMessageText?.trim().isNotEmpty == true`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L45** `? room.lastMessageText!.trim()`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L46** `: l10n.chatPreviewFile,`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L47** `ChatMessageType.text || null =>`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L48** `room.lastMessageText?.trim().isNotEmpty == true`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L49** `? room.lastMessageText!.trim()`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L50** `: l10n.chatNoMessagesYet,`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L51** `};`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L54** `String _formatTime(DateTime? dt) {`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L55** `if (dt == null) return '';`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L56** `final local = dt.toLocal();`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L57** `final now = DateTime.now();`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

> **CHECKPOINT — Closed lib/screens/chat/list/chat_list_screen.dart**
> Name the file’s public API in one breath. If you cannot, reread the class/provider table in the annotated chapter.

# Every line — lib/screens/chat/room/chat_room_screen.dart

Application source used by MU Study. Read the imports first, then the public types, then the widget build or provider body.

**L30** `class ChatRoomScreen extends ConsumerStatefulWidget {`
Type definition. If this is a widget, find build(). If this is a repository, find the supabase calls.

**L31** `const ChatRoomScreen({super.key, required this.roomId});`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L33** `final String roomId;`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L35** `@override`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L36** `ConsumerState<ChatRoomScreen> createState() => _ChatRoomScreenState();`
Widget that can watch providers. Required for profile/theme/locale.

**L39** `class _ChatRoomScreenState extends ConsumerState<ChatRoomScreen>`
Type definition. If this is a widget, find build(). If this is a repository, find the supabase calls.

**L40** `with WidgetsBindingObserver {`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L41** `static const _nearBottomThreshold = 120.0;`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L43** `static const _recentActivityWindow = Duration(minutes: 3);`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L45** `final _text = TextEditingController();`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L46** `final _scroll = ScrollController();`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L47** `final _recorder = AudioRecorder();`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L48** `final _focus = FocusNode();`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L50** `bool _sending = false;`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L51** `bool _attachOpen = false;`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L52** `bool _recording = false;`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L53** `double _uploadProgress = 0;`
Storage write. Path folders must satisfy bucket policies.

**L54** `String? _uploadLabel;`
Storage write. Path folders must satisfy bucket policies.

**L55** `Duration _recordElapsed = Duration.zero;`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L56** `Timer? _recordTick;`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L57** `Timer? _typingIdle;`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L58** `Timer? _presenceHeartbeat;`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L59** `Timer? _presencePoll;`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L60** `RealtimeChannel? _typingChannel;`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L61** `List<String> _typingNames = const [];`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L62** `final Set<String> _presenceOnlineIds = {};`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

Widget that can watch providers. Required for profile/theme/locale.

**L22** `class _StudentFocusScreenState extends ConsumerState<StudentFocusScreen>`
Type definition. If this is a widget, find build(). If this is a repository, find the supabase calls.

**L23** `with WidgetsBindingObserver {`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L24** `Timer? _tick;`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L25** `final _noteController = TextEditingController();`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L27** `@override`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L28** `void initState() {`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L29** `super.initState();`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L30** `WidgetsBinding.instance.addObserver(this);`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L31** `_tick = Timer.periodic(const Duration(seconds: 1), (_) {`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L32** `if (!mounted) return;`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L33** `final session = ref.read(focusSessionProvider).session;`
One-shot access, typical in onPressed. Login uses read(authRepositoryProvider).

**L34** `if (session == null || session.isPaused) return;`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L35** `setState(() {});`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L36** `_finishIfTimedOut(session);`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L40** `@override`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L41** `void dispose() {`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L42** `WidgetsBinding.instance.removeObserver(this);`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L43** `_tick?.cancel();`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L44** `_noteController.dispose();`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L45** `super.dispose();`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L48** `@override`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L49** `void didChangeAppLifecycleState(AppLifecycleState state) {`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L50** `if (state == AppLifecycleState.resumed) {`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L51** `final session = ref.read(focusSessionProvider).session;`
One-shot access, typical in onPressed. Login uses read(authRepositoryProvider).

**L52** `if (session != null) _finishIfTimedOut(session);`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L56** `void _finishIfTimedOut(FocusSession session) {`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L57** `if (!session.isCompleteAt()) return;`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L58** `ref.read(focusSessionProvider.notifier).endSession(timedOut: true);`
One-shot access, typical in onPressed. Login uses read(authRepositoryProvider).

**L61** `Future<void> _pickModeAndStart(Assignment a) async {`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L62** `final l10n = context.l10n;`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L63** `final mode = await showModalBottomSheet<FocusTimerMode>(`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L64** `context: context,`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L65** `showDragHandle: true,`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L66** `builder: (ctx) {`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L67** `return SafeArea(`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L68** `child: Padding(`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L69** `padding: const EdgeInsets.fromLTRB(20, 8, 20, 24),`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L70** `child: Column(`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L71** `mainAxisSize: MainAxisSize.min,`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L72** `crossAxisAlignment: CrossAxisAlignment.stretch,`

Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L73** `children: [`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L74** `Text(`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L75** `l10n.focusChooseMode,`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L76** `style: Theme.of(ctx).textTheme.titleMedium?.copyWith(`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L104** `),`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L105** `leading: Icon(`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L106** `Icons.all_inclusive_rounded,`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L107** `color: AppColors.accent(ctx),`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L108** `),`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L109** `title: Text(l10n.focusModeFree),`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L110** `subtitle: Text(l10n.focusModeFreeHint),`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L111** `onTap: () => Navigator.pop(ctx, FocusTimerMode.free),`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L112** `),`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L114** `),`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L115** `),`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L117** `},`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L119** `if (mode == null || !mounted) return;`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L120** `await ref`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L121** `.read(focusSessionProvider.notifier)`
Riverpod binding. Name it after the value it exposes.

**L122** `.start(assignmentId: a.id, assignmentTitle: a.title, mode: mode);`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L125** `@override`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L126** `Widget build(BuildContext context) {`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L127** `final focus = ref.watch(focusSessionProvider);`
Rebuild this widget/provider when the dependency changes. Do not put watch in a click handler.

**L128** `if (focus.session != null) {`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L129** `return ActiveSessionView(`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L130** `session: focus.session!,`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L131** `formatDuration: formatFocusDuration,`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L132** `onPause: () => ref.read(focusSessionProvider.notifier).pause(),`
One-shot access, typical in onPressed. Login uses read(authRepositoryProvider).

**L133** `onResume: () => ref.read(focusSessionProvider.notifier).resume(),`
One-shot access, typical in onPressed. Login uses read(authRepositoryProvider).

**L134** `onEnd: () => ref.read(focusSessionProvider.notifier).endSession(),`
One-shot access, typical in onPressed. Login uses read(authRepositoryProvider).

**L135** `onOpenTask: () =>`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L136** `context.push('/student/assignments/${focus.session!.assignmentId}'),`
Push a route the user can pop (assignment detail, chat room).

**L139** `if (focus.summary != null) {`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L140** `final summary = focus.summary!;`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L141** `if (_noteController.text != (summary.note ?? '') &&`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L142** `summary.note != null) {`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L143** `_noteController.text = summary.note!;`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L145** `return FocusSummaryView(`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L146** `summary: summary,`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L147** `formatDuration: formatFocusDuration,`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L148** `noteController: _noteController,`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L149** `onNoteChanged: (v) =>`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L150** `ref.read(focusSessionProvider.notifier).setSummaryNote(v),`
One-shot access, typical in onPressed. Login uses read(authRepositoryProvider).

**L151** `onOpenTask: () {`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L152** `ref.read(focusSessionProvider.notifier).dismissSummary();`
One-shot access, typical in onPressed. Login uses read(authRepositoryProvider).

**L153** `context.push('/student/assignments/${summary.assignmentId}');`
Push a route the user can pop (assignment detail, chat room).

**L154** `},`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L155** `onDone: () => ref.read(focusSessionProvider.notifier).dismissSummary(),`
One-shot access, typical in onPressed. Login uses read(authRepositoryProvider).

**L158** `return FocusHomeView(onStart: _pickModeAndStart);`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**CHECKPOINT — Closed lib/screens/student/focus/student_focus_screen.dart**
Name the file's public API in one breath. If you cannot, reread the class/provider table in the annotated chapter.

# Every line — lib/screens/student/focus/widgets/active_session_view.dart

Application source used by MU Study. Read the imports first, then the public types, then the widget build or provider body.

**L8** `class ActiveSessionView extends StatelessWidget {`
Type definition. If this is a widget, find build(). If this is a repository, find the supabase calls.

**L35** `class _StudentDashboardScreenState`
Type definition. If this is a widget, find build(). If this is a repository, find the supabase calls.

**L36** `extends ConsumerState<StudentDashboardScreen> {`
Widget that can watch providers. Required for profile/theme/locale.

**L37** `late final int _dailyGreetingIndex;`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L39** `@override`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L40** `void initState() {`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L41** `super.initState();`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L42** `_dailyGreetingIndex = Random().nextInt(4);`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L45** `String _dailyMotivation(AppLocalizations l10n) {`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L46** `final lines = [`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L47** `l10n.dailyMotivation1,`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L48** `l10n.dailyMotivation2,`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L49** `l10n.dailyMotivation3,`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L50** `l10n.dailyMotivation4,`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L52** `return lines[_dailyGreetingIndex];`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L55** `@override`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L56** `Widget build(BuildContext context) {`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L57** `final l10n = context.l10n;`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L58** `final profile = ref.watch(currentProfileProvider);`
Rebuild this widget/provider when the dependency changes. Do not put watch in a click handler.

**L59** `final groupId = ref.watch(activeGroupIdProvider);`
Rebuild this widget/provider when the dependency changes. Do not put watch in a click handler.

**L60** `final assignments = ref.watch(assignmentsProvider(groupId));`
Rebuild this widget/provider when the dependency changes. Do not put watch in a click handler.

**L61** `final notifications = ref.watch(notificationsProvider);`
Rebuild this widget/provider when the dependency changes. Do not put watch in a click handler.

**L62** `final announcements = ref.watch(announcementsProvider(groupId));`
Rebuild this widget/provider when the dependency changes. Do not put watch in a click handler.

**L63** `final marks = ref.watch(myMarksProvider);`
Rebuild this widget/provider when the dependency changes. Do not put watch in a click handler.

**L64** `final average = ref.watch(myMarkAverageProvider).valueOrNull;`
Rebuild this widget/provider when the dependency changes. Do not put watch in a click handler.

> **CHECKPOINT — Closed lib/screens/student/home/widgets/expandable_announcement_card.dart**
> Name the file's public API in one breath. If you cannot, reread the class/provider table in the annotated chapter.

# Every line — lib/screens/student/homework/student_assignments_screen.dart

Application source used by MU Study. Read the imports first, then the public types, then the widget build or provider body.

**L19** `class StudentAssignmentsScreen extends ConsumerWidget {`
Type definition. If this is a widget, find build(). If this is a repository, find the supabase calls.

**L20** `const StudentAssignmentsScreen({super.key});`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L22** `void _open(BuildContext context, Assignment a) {`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L23** `context.push('/student/assignments/${a.id}');`
Push a route the user can pop (assignment detail, chat room).

**L26** `@override`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L27** `Widget build(BuildContext context, WidgetRef ref) {`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L28** `final groupId = ref.watch(activeGroupIdProvider);`
Rebuild this widget/provider when the dependency changes. Do not put watch in a click handler.

**L29** `final assignments = ref.watch(assignmentsProvider(groupId));`
Rebuild this widget/provider when the dependency changes. Do not put watch in a click handler.

**L31** `final l10n = context.l10n;`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L32** `return Scaffold(`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L33** `extendBody: true,`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L34** `appBar: AppBar(title: Text(l10n.assignmentsTitle)),`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L35** `body: assignments.when(`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L36** `data: (page) {`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L37** `final list = sortAssignmentsByDue(page.items);`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L38** `if (list.isEmpty) {`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L39** `return ListView(`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L40** `padding: EdgeInsets.only(`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**CHECKPOINT — Closed lib/screens/student/homework/student_assignments_screen.dart**
Name the file's public API in one breath. If you cannot, reread the class/provider table in the annotated chapter.

# Every line — lib/screens/student/homework/student_task_submit_screen.dart

Application source used by MU Study. Read the imports first, then the public types, then the widget build or provider body.

**L21** `class StudentTaskSubmitScreen extends ConsumerStatefulWidget {`
Type definition. If this is a widget, find build(). If this is a repository, find the supabase calls.

**L22** `const StudentTaskSubmitScreen({super.key, required this.taskId});`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L24** `final String taskId;`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L26** `@override`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L27** `ConsumerState<StudentTaskSubmitScreen> createState() =>`
Widget that can watch providers. Required for profile/theme/locale.

**L28** `_StudentTaskSubmitScreenState();`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L31** `const _signedUrlTtlSeconds = 60 * 60 * 24 * 365 * 10;`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L33** `class _StudentTaskSubmitScreenState`
Type definition. If this is a widget, find build(). If this is a repository, find the supabase calls.

**L34** `extends ConsumerState<StudentTaskSubmitScreen> {`
Widget that can watch providers. Required for profile/theme/locale.

**L35** `final _textController = TextEditingController();`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L36** `bool _loading = false;`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L37** `bool _completed = false;`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L38** `String? _fileUrl;`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L39** `String? _fileName;`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L40** `String? _storagePath;`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L41** `Uint8List? _localBytes;`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L42** `String? _voiceUrl;`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L43** `String? _voiceStoragePath;`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L44** `Map<String, dynamic>? _task;`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L46** `@override`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L47** `void initState() {`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L48** `super.initState();`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L49** `_load();`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L52** `Future<void> _load() async {`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L53** `final task = await supabase`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L54** `.from('tasks')`
PostgREST table access. RLS still applies. The string is the Postgres table or view name.

**L55** `.select()`
Read columns. Narrow the select when the row is wide; '*' is acceptable for small domain rows.

**L56** `.eq('id', widget.taskId)`
Equality filter. This is the WHERE clause. Wrong UUID type (profile vs student id) yields empty lists.

**L57** `.maybeSingle();`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L58** `if (task != null) setState(() => _task = Map<String, dynamic>.from(task));`
PostgREST table access. RLS still applies. The string is the Postgres table or view name.

**L60** `final student = await ref.read(studentProfileProvider.future);`
One-shot access, typical in onPressed. Login uses read(authRepositoryProvider).

**L61** `if (student == null) return;`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L62** `final sub = await supabase`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L63** `.from('submissions')`
PostgREST table access. RLS still applies. The string is the Postgres table or view name.

**L64** `.select()`
Read columns. Narrow the select when the row is wide; '*' is acceptable for small domain rows.

**L65** `.eq('task_id', widget.taskId)`
Equality filter. This is the WHERE clause. Wrong UUID type (profile vs student id) yields empty lists.

**L66** `.eq('student_id', student.id)`
Equality filter. This is the WHERE clause. Wrong UUID type (profile vs student id) yields empty lists.

**L67** `.maybeSingle();`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L68** `if (sub != null && mounted) {`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L69** `final url = sub['file_url'] as String?;`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L70** `final voice = sub['voice_url'] as String?;`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L71** `setState(() {`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L72** `_textController.text = sub['text_answer'] as String? ?? '';`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L74** `_fileName = url == null ? null : attachmentFileName(url);`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L75** `_storagePath = url == null ? null : storagePathFromSignedUrl(url);`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L76** `_localBytes = null;`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L77** `_voiceUrl = voice;`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L78** `_voiceStoragePath = voice == null`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L79** `? null`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L80** `: storagePathFromSignedUrl(voice);`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L81** `_completed = sub['is_completed'] as bool? ?? false;`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L86** `Future<void> _storeAttachment({`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L87** `required String studentId,`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L88** `required String fileName,`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L89** `required Uint8List bytes,`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L90** `}) async {`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L91** `final path = '$studentId/${widget.taskId}/$fileName';`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L92** `await supabase.storage`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L93** `.from('submissions')`
PostgREST table access. RLS still applies. The string is the Postgres table or view name.

**L94** `.uploadBinary(`
Storage write. Path folders must satisfy bucket policies.

**L95** `path,`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L96** `bytes,`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L97** `fileOptions: const FileOptions(upsert: true),`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L99** `final url = await supabase.storage`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L100** `.from('submissions')`

PostgREST table access. RLS still applies. The string is the Postgres table or view name.

**L101** `.createSignedUrl(path, _signedUrlTtlSeconds);`
Storage read. Private buckets need a signed URL; avatars may use getPublicUrl.

**L102** `if (!mounted) return;`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L103** `setState(() {`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L136** `final student = await ref.read(studentProfileProvider.future);`
One-shot access, typical in onPressed. Login uses read(authRepositoryProvider).

**L137** `if (student == null) return;`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L138** `final picker = ImagePicker();`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L139** `final image = await picker.pickImage(`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L140** `source: ImageSource.gallery,`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L141** `imageQuality: 88,`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L143** `if (image == null) return;`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L144** `final bytes = await image.readAsBytes();`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L145** `setState(() => _loading = true);`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L146** `try {`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L147** `await _storeAttachment(`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L148** `studentId: student.id,`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L149** `fileName: image.name,`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L150** `bytes: bytes,`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L152** `} catch (e) {`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L153** `if (!mounted) return;`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L154** `_showError(context.l10n.taskUploadFailed('$e'));`
Storage write. Path folders must satisfy bucket policies.

**L155** `} finally {`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L156** `if (mounted) setState(() => _loading = false);`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L160** `Future<void> _removeAttachment() async {`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L161** `final path = _storagePath;`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L162** `setState(() {`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L163** `_fileUrl = null;`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L164** `_fileName = null;`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L165** `_storagePath = null;`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L166** `_localBytes = null;`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L169** `if (path != null) {`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L170** `try {`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L171** `await supabase.storage.from('submissions').remove([path]);`
PostgREST table access. RLS still applies. The string is the Postgres table or view name.

**L172** `} catch (_) {}`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L175** `final student = await ref.read(studentProfileProvider.future);`
One-shot access, typical in onPressed. Login uses read(authRepositoryProvider).

**L176** `if (student == null) return;`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L177** `try {`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L178** `await supabase`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L179** `.from('submissions')`
PostgREST table access. RLS still applies. The string is the Postgres table or view name.

**L180** `.update({'file_url': null})`
Mutates matching rows. Silent zero rows usually means SELECT policy is missing for UPDATE.

**L181** `.eq('task_id', widget.taskId)`
Equality filter. This is the WHERE clause. Wrong UUID type (profile vs student id) yields empty lists.

**L182** `.eq('student_id', student.id);`
Equality filter. This is the WHERE clause. Wrong UUID type (profile vs student id) yields empty lists.

**L183** `} catch (_) {}`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L186** `Future<void> _uploadVoice(Uint8List bytes, String fileName) async {`
Storage write. Path folders must satisfy bucket policies.

**L187** `final student = await ref.read(studentProfileProvider.future);`
One-shot access, typical in onPressed. Login uses read(authRepositoryProvider).

**L188** `if (student == null) return;`

Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L190** `setState(() => _loading = true);`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L191** `try {`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L192** `final path = '${student.id}/${widget.taskId}/voice/$fileName';`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L193** `await supabase.storage`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L194** `.from('submissions')`
PostgREST table access. RLS still applies. The string is the Postgres table or view name.

**L195** `.uploadBinary(`
Storage write. Path folders must satisfy bucket policies.

**L196** `path,`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L197** `bytes,`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L198** `fileOptions: FileOptions(`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L199** `upsert: true,`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L200** `contentType: fileName.endsWith('.wav')`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L201** `? 'audio/wav'`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L202** `: 'audio/mp4',`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L203** `),`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L205** `final url = await supabase.storage`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L206** `.from('submissions')`
PostgREST table access. RLS still applies. The string is the Postgres table or view name.

**L207** `.createSignedUrl(path, _signedUrlTtlSeconds);`
Storage read. Private buckets need a signed URL; avatars may use getPublicUrl.

**L208** `if (!mounted) return;`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L209** `setState(() {`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L210** `_voiceUrl = url;`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L211** `_voiceStoragePath = path;`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L213** `} catch (e) {`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L214** `if (mounted) _showError(context.l10n.taskVoiceUploadFailed('$e'));`
Storage write. Path folders must satisfy bucket policies.

**L215** `rethrow;`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L216** `} finally {`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L217** `if (mounted) setState(() => _loading = false);`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L221** `Future<void> _removeVoice() async {`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L222** `final path = _voiceStoragePath;`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L223** `setState(() {`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L224** `_voiceUrl = null;`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L225** `_voiceStoragePath = null;`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L228** `if (path != null) {`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L229** `try {`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L230** `await supabase.storage.from('submissions').remove([path]);`
PostgREST table access. RLS still applies. The string is the Postgres table or view name.

**L231** `} catch (_) {}`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L234** `final student = await ref.read(studentProfileProvider.future);`
One-shot access, typical in onPressed. Login uses read(authRepositoryProvider).

**L235** `if (student == null) return;`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L236** `try {`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L237** `await supabase`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L238** `.from('submissions')`
PostgREST table access. RLS still applies. The string is the Postgres table or view name.

**L239** `.update({'voice_url': null})`
Mutates matching rows. Silent zero rows usually means SELECT policy is missing for UPDATE.

**L240** `.eq('task_id', widget.taskId)`
Equality filter. This is the WHERE clause. Wrong UUID type (profile vs student id) yields empty lists.

**L241** `.eq('student_id', student.id);`
Equality filter. This is the WHERE clause. Wrong UUID type (profile vs student id) yields empty lists.

**L242** `} catch (_) {}`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L245** `void _showError(String message) {`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L246** `if (!mounted) return;`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

> **CHECKPOINT — Closed lib/screens/student/homework/student_task_submit_screen.dart**
> Name the file's public API in one breath. If you cannot, reread the class/provider table in the annotated chapter.

# Every line — lib/screens/student/marks/student_marks_screen.dart

Application source used by MU Study. Read the imports first, then the public types, then the widget build or provider body.

**L23** `class StudentMarksScreen extends ConsumerWidget {`
Type definition. If this is a widget, find build(). If this is a repository, find the supabase calls.

**L24** `const StudentMarksScreen({super.key});`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L26** `@override`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L27** `Widget build(BuildContext context, WidgetRef ref) {`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L28** `final marks = ref.watch(myMarksProvider);`
Rebuild this widget/provider when the dependency changes. Do not put watch in a click handler.

**L29** `final stats = ref.watch(myMarkStatsProvider);`
Rebuild this widget/provider when the dependency changes. Do not put watch in a click handler.

**L30** `final average = ref.watch(myMarkAverageProvider).valueOrNull;`
Rebuild this widget/provider when the dependency changes. Do not put watch in a click handler.

**L31** `final markCount = stats.valueOrNull?.length ?? 0;`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L32** `final l10n = context.l10n;`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L34** `return Scaffold(`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L35** `appBar: AppBar(`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L36** `title: Text(l10n.marksTitle),`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L37** `actions: [`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L38** `IconButton(`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L39** `tooltip: l10n.progressReportShare,`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L40** `onPressed: () => _shareProgress(context, ref),`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L41** `icon: const Icon(Icons.ios_share_rounded),`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L42** `),`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L44** `),`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

> **CHECKPOINT — Closed lib/screens/teacher/analytics/teacher_analytics_screen.dart**
> Name the file's public API in one breath. If you cannot, reread the class/provider table in the annotated chapter.

# Every line — lib/screens/teacher/announcements/teacher_announcements_screen.dart

Application source used by MU Study. Read the imports first, then the public types, then the widget build or provider body.

**L16** `class TeacherAnnouncementsScreen extends ConsumerStatefulWidget {`
Type definition. If this is a widget, find build(). If this is a repository, find the supabase calls.

**L17** `const TeacherAnnouncementsScreen({super.key});`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L19** `@override`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L20** `ConsumerState<TeacherAnnouncementsScreen> createState() =>`
Widget that can watch providers. Required for profile/theme/locale.

**L21** `_TeacherAnnouncementsScreenState();`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L24** `class _TeacherAnnouncementsScreenState`
Type definition. If this is a widget, find build(). If this is a repository, find the supabase calls.

**L25** `extends ConsumerState<TeacherAnnouncementsScreen> {`
Widget that can watch providers. Required for profile/theme/locale.

**L26** `Future<void> _create() async {`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L27** `final teacher = await ref.read(teacherProfileProvider.future);`
One-shot access, typical in onPressed. Login uses read(authRepositoryProvider).

**L28** `final groups = await ref.read(myGroupsProvider.future);`
One-shot access, typical in onPressed. Login uses read(authRepositoryProvider).

**L29** `if (teacher == null || groups.isEmpty) return;`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L30** `final title = TextEditingController();`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L31** `final body = TextEditingController();`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L32** `var groupId = ref.read(activeGroupIdProvider) ?? groups.first.id;`
One-shot access, typical in onPressed. Login uses read(authRepositoryProvider).

**L34** `if (!mounted) return;`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L35** `final l10n = context.l10n;`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L36** `await showDialog<void>(`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L37** `context: context,`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L38** `builder: (ctx) => StatefulBuilder(`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L39** `builder: (ctx, setStateLocal) => AlertDialog(`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L40** `title: Text(l10n.announcementsNew),`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L41** `content: SingleChildScrollView(`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L42** `child: Column(`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L43** `mainAxisSize: MainAxisSize.min,`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L44** `children: [`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L45** `TextField(`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L46** `controller: title,`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L47** `decoration: InputDecoration(labelText: l10n.commonTitle),`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L48** `),`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L49** `const SizedBox(height: 16),`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L50** `TextField(`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L51** `controller: body,`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L52** `decoration: InputDecoration(labelText: l10n.commonMessage),`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L53** `maxLines: 4,`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L54** `),`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L55** `const SizedBox(height: 16),`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L56** `DropdownButtonFormField<String>(`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L57** `initialValue: groupId,`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L58** `decoration: InputDecoration(`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L59** `labelText: l10n.teacherTargetGroup,`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L60** `),`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L61** `items: groups`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L62** `.map(`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L63** `(g) =>`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L64** `DropdownMenuItem(value: g.id, child: Text(g.title)),`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L66** `.toList(),`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L67** `onChanged: (v) => setStateLocal(() => groupId = v ?? groupId),`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L68** `),`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L70** `),`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L71** `),`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L72** `actions: [`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L73** `TextButton(`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L74** `onPressed: () => Navigator.pop(ctx),`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L75** `child: Text(l10n.commonCancel),`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L76** `),`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L77** `ElevatedButton(`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L78** `onPressed: () async {`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L79** `if (title.text.trim().isEmpty) return;`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L80** `await supabase.from('announcements').insert({`
PostgREST table access. RLS still applies. The string is the Postgres table or view name.

**L81** `'teacher_id': teacher.id,`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L82** `'group_id': groupId,`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L83** `'title': title.text.trim(),`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L84** `'description': body.text.trim(),`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L86** `if (ctx.mounted) Navigator.pop(ctx);`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L87** `ref.invalidate(announcementsProvider);`
Drop cached AsyncValue so the next watch refetches (after login or a mutation).

**L88** `},`

Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L89** `child: Text(l10n.announcementsPost),`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L90** `),`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L92** `),`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L93** `),`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L97** `Future<void> _edit(Announcement a) async {`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L98** `final l10n = context.l10n;`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L99** `final title = TextEditingController(text: a.title);`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L100** `final body = TextEditingController(text: a.description);`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L125** `child: Text(l10n.commonCancel),`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L126** `),`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L127** `ElevatedButton(`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L128** `onPressed: () async {`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L129** `if (title.text.trim().isEmpty) return;`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L130** `await supabase`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L131** `.from('announcements')`
PostgREST table access. RLS still applies. The string is the Postgres table or view name.

**L132** `.update({`
Mutates matching rows. Silent zero rows usually means SELECT policy is missing for UPDATE.

**L133** `'title': title.text.trim(),`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L134** `'description': body.text.trim(),`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L135** `})`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L136** `.eq('id', a.id);`
Equality filter. This is the WHERE clause. Wrong UUID type (profile vs student id) yields empty lists.

**L137** `if (ctx.mounted) Navigator.pop(ctx);`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L138** `ref.invalidate(announcementsProvider);`
Drop cached AsyncValue so the next watch refetches (after login or a mutation).

> **CHECKPOINT — Closed lib/screens/teacher/announcements/teacher_announcements_screen.dart**
> Name the file's public API in one breath. If you cannot, reread the class/provider table in the annotated chapter.

# Every line — lib/screens/teacher/assignments/teacher_assignments_screen.dart

Application source used by MU Study. Read the imports first, then the public types, then the widget build or provider body.

**L23** `class TeacherAssignmentsScreen extends ConsumerStatefulWidget {`
Type definition. If this is a widget, find build(). If this is a repository, find the supabase calls.

**L24** `const TeacherAssignmentsScreen({super.key});`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L26** `@override`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L27** `ConsumerState<TeacherAssignmentsScreen> createState() =>`
Widget that can watch providers. Required for profile/theme/locale.

**L28** `_TeacherAssignmentsScreenState();`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L31** `class _TeacherAssignmentsScreenState`
Type definition. If this is a widget, find build(). If this is a repository, find the supabase calls.

**L32** `extends ConsumerState<TeacherAssignmentsScreen> {`
Widget that can watch providers. Required for profile/theme/locale.

**L33** `void _openPack(BuildContext context, Assignment a) {`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L34** `context.push('/teacher/assignments/${a.id}');`
Push a route the user can pop (assignment detail, chat room).

**L37** `Future<void> _createAssignment({AssignmentTemplate? fromTemplate}) async {`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L38** `final teacher = await ref.read(teacherProfileProvider.future);`
One-shot access, typical in onPressed. Login uses read(authRepositoryProvider).

**L39** `final groups = await ref.read(myGroupsProvider.future);`
One-shot access, typical in onPressed. Login uses read(authRepositoryProvider).

**L40** `if (teacher == null || groups.isEmpty) return;`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L42** `var targetGroupId = ref.read(activeGroupIdProvider) ?? groups.first.id;`
One-shot access, typical in onPressed. Login uses read(authRepositoryProvider).

**L43** `final titleController = TextEditingController(`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L44** `text: fromTemplate?.title ?? '',`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L46** `final descController = TextEditingController(`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L47** `text: fromTemplate?.description ?? '',`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L49** `var type = fromTemplate?.type ?? AssignmentType.staticAssignment;`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L50** `DateTime? dueDate;`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L52** `if (!mounted) return;`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L53** `final l10n = context.l10n;`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L54** `await showDialog<void>(`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L55** `context: context,`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L56** `builder: (ctx) => StatefulBuilder(`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L310** `try {`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L311** `await supabase`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L312** `.from('assignments')`
PostgREST table access. RLS still applies. The string is the Postgres table or view name.

**L313** `.update({`
Mutates matching rows. Silent zero rows usually means SELECT policy is missing for UPDATE.

**L314** `'title': title,`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L315** `'description': description,`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L316** `'due_date': dueDate?.toIso8601String(),`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L317** `})`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L318** `.eq('id', a.id);`
Equality filter. This is the WHERE clause. Wrong UUID type (profile vs student id) yields empty lists.

**L319** `if (a.type == AssignmentType.staticAssignment) {`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L320** `final tasks = await supabase`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L321** `.from('tasks')`

PostgREST table access. RLS still applies. The string is the Postgres table or view name.

**L322** `.select('id')`
Read columns. Narrow the select when the row is wide; '*' is acceptable for small domain rows.

**L323** `.eq('assignment_id', a.id)`
Equality filter. This is the WHERE clause. Wrong UUID type (profile vs student id) yields empty lists.

**L324** `.order('sort_order')`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L325** `.limit(1);`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

> **CHECKPOINT — Closed lib/screens/teacher/assignments/teacher_assignments_screen.dart**
> Name the file's public API in one breath. If you cannot, reread the class/provider table in the annotated chapter.

# Every line — lib/screens/teacher/attendance/teacher_attendance_screen.dart

Application source used by MU Study. Read the imports first, then the public types, then the widget build or provider body.

**L16** `class TeacherAttendanceScreen extends ConsumerStatefulWidget {`
Type definition. If this is a widget, find build(). If this is a repository, find the supabase calls.

**L17** `const TeacherAttendanceScreen({super.key});`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L19** `@override`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L20** `ConsumerState<TeacherAttendanceScreen> createState() =>`
Widget that can watch providers. Required for profile/theme/locale.

**L21** `_TeacherAttendanceScreenState();`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L24** `class _TeacherAttendanceScreenState`
Type definition. If this is a widget, find build(). If this is a repository, find the supabase calls.

**L25** `extends ConsumerState<TeacherAttendanceScreen>`
Widget that can watch providers. Required for profile/theme/locale.

**L26** `with SingleTickerProviderStateMixin {`
Riverpod binding. Name it after the value it exposes.

**L27** `final Map<String, AttendanceStatus> _edits = {};`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L28** `String? _editedGroupId;`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L29** `bool _saving = false;`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L30** `late final TabController _tabs;`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L31** `late DateTime _month;`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L32** `String? _historyStudentId;`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L34** `@override`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L35** `void initState() {`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L36** `super.initState();`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L37** `_tabs = TabController(length: 2, vsync: this);`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L38** `final now = DateTime.now();`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L39** `_month = DateTime(now.year, now.month);`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

> **CHECKPOINT — Closed lib/screens/teacher/dashboard/teacher_dashboard_screen.dart**
> Name the file's public API in one breath. If you cannot, reread the class/provider table in the annotated chapter.

# Every line — lib/screens/teacher/homework/teacher_homework_pack_screen.dart

Application source used by MU Study. Read the imports first, then the public types, then the widget build or provider body.

**L15** `class TeacherHomeworkPackScreen extends ConsumerStatefulWidget {`
Type definition. If this is a widget, find build(). If this is a repository, find the supabase calls.

**L16** `const TeacherHomeworkPackScreen({super.key, required this.assignmentId});`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L18** `final String assignmentId;`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L20** `@override`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L21** `ConsumerState<TeacherHomeworkPackScreen> createState() =>`
Widget that can watch providers. Required for profile/theme/locale.

**L22** `_TeacherHomeworkPackScreenState();`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L25** `class _TeacherHomeworkPackScreenState`
Type definition. If this is a widget, find build(). If this is a repository, find the supabase calls.

**L26** `extends ConsumerState<TeacherHomeworkPackScreen> {`
Widget that can watch providers. Required for profile/theme/locale.

**L27** `Future<void> _saveAsTemplate(Assignment? assignment) async {`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L28** `if (assignment == null) return;`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L29** `final teacher = await ref.read(teacherProfileProvider.future);`
One-shot access, typical in onPressed. Login uses read(authRepositoryProvider).

**L30** `if (teacher == null || !mounted) return;`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L31** `final l10n = context.l10n;`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L32** `try {`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L33** `await saveAssignmentAsTemplate(`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L34** `teacherId: teacher.id,`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L35** `assignment: assignment,`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L37** `if (!mounted) return;`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L38** `ScaffoldMessenger.of(`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L39** `context,`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L40** `).showSnackBar(SnackBar(content: Text(l10n.teacherTemplateSaved)));`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L41** `} catch (e) {`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L42** `if (!mounted) return;`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L43** `ScaffoldMessenger.of(`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L44** `context,`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L45** `).showSnackBar(SnackBar(content: Text(l10n.commonCouldNotSave('$e'))));`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L49** `Future<void> _showTaskDialog({TaskItem? task, int currentCount = 0}) async {`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L50** `final assignment = ref`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L51** `.read(assignmentDetailProvider(widget.assignmentId))`
Riverpod binding. Name it after the value it exposes.

**L52** `.valueOrNull;`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L53** `if (assignment?.type == AssignmentType.staticAssignment) return;`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L55** `final isEditing = task != null;`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L56** `final titleController = TextEditingController(text: task?.title ?? '');`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L57** `final descController = TextEditingController(text: task?.description ?? '');`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L58** `final linkController = TextEditingController(text: task?.linkUrl ?? '');`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L59** `final attachmentController = TextEditingController(`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L60** `text: task?.attachmentUrl ?? '',`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L63** `if (!mounted) return;`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L64** `final l10n = context.l10n;`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L66** `await showDialog<void>(`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**CHECKPOINT — Closed lib/screens/teacher/homework/teacher_homework_pack_screen.dart**
Name the file's public API in one breath. If you cannot, reread the class/provider table in the annotated chapter.

# Every line — lib/screens/teacher/homework/teacher_submissions_screen.dart

Application source used by MU Study. Read the imports first, then the public types, then the widget build or provider body.

**L19** `class TeacherSubmissionsScreen extends ConsumerWidget {`
Type definition. If this is a widget, find build(). If this is a repository, find the supabase calls.

**L20** `const TeacherSubmissionsScreen({super.key});`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L22** `@override`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L23** `Widget build(BuildContext context, WidgetRef ref) {`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L24** `final submissions = ref.watch(teacherSubmissionsProvider);`
Rebuild this widget/provider when the dependency changes. Do not put watch in a click handler.

**L25** `final l10n = context.l10n;`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L27** `return Scaffold(`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L28** `appBar: AppBar(title: Text(l10n.teacherSubmissions)),`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L29** `body: submissions.when(`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L30** `loading: () => const Center(child: CircularProgressIndicator()),`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L31** `error: (e, _) => ErrorState(message: e.toString()),`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L32** `data: (rows) {`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L33** `if (rows.isEmpty) {`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

> **CHECKPOINT — Closed lib/screens/teacher/homework/teacher_submissions_screen.dart**
> Name the file's public API in one breath. If you cannot, reread the class/provider table in the annotated chapter.

# Every line — lib/screens/teacher/marks/teacher_marks_screen.dart

Application source used by MU Study. Read the imports first, then the public types, then the widget build or provider body.

**L23** `class TeacherMarksScreen extends ConsumerWidget {`
Type definition. If this is a widget, find build(). If this is a repository, find the supabase calls.

**L24** `const TeacherMarksScreen({super.key});`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L26** `@override`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L27** `Widget build(BuildContext context, WidgetRef ref) {`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L28** `final groupId = ref.watch(activeGroupIdProvider);`
Rebuild this widget/provider when the dependency changes. Do not put watch in a click handler.

**L29** `final l10n = context.l10n;`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L31** `if (groupId == null) {`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L32** `return Scaffold(`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L33** `appBar: AppBar(title: Text(l10n.teacherGradebook)),`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L34** `body: EmptyState(`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L35** `title: l10n.teacherNoGroups,`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L36** `subtitle: l10n.teacherNoGroupsSubtitle,`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L37** `icon: Icons.groups_outlined,`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L38** `),`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L42** `final members = ref.watch(groupMembersProvider(groupId));`
Rebuild this widget/provider when the dependency changes. Do not put watch in a click handler.

**L43** `final averages = ref.watch(groupMarkAveragesProvider(groupId));`
Rebuild this widget/provider when the dependency changes. Do not put watch in a click handler.

**L44** `final marks = ref.watch(groupMarksProvider(groupId));`
Rebuild this widget/provider when the dependency changes. Do not put watch in a click handler.

**L45** `final markCount =`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L46** `ref.watch(groupMarkCountProvider(groupId)).valueOrNull ?? 0;`
Rebuild this widget/provider when the dependency changes. Do not put watch in a click handler.

**L47** `final groups = ref.watch(myGroupsProvider).valueOrNull ?? const [];`
Rebuild this widget/provider when the dependency changes. Do not put watch in a click handler.

**L48** `final groupTitle = groups`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L49** `.where((g) => g.id == groupId)`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L50** `.map((g) => g.title)`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L51** `.firstOrNull;`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L53** `return Scaffold(`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L54** `appBar: AppBar(`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L55** `title: Text(l10n.teacherGradebook),`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

**L56** `actions: [`
Product logic on this line. Read the surrounding ten lines if the token is unfamiliar.

# RLS policies in English

Each policy is a sentence you should be able to say to a school principal.

## profiles_admin_all on public.profiles

**profiles_admin_all**

```
CREATE POLICY profiles_admin_all ON public.profiles FOR ALL TO authenticated
  USING (is_admin()) WITH CHECK (is_admin());
```

This is a write rule. Ask: who is auth.uid()? Does the function is_admin / is_teacher_of_group / is_student_in_group / can_access_chat_room appear? If the policy is USING(true), it is a red flag unless the table is harmless.

> **CHECKPOINT — Say profiles_admin_all aloud**
> Complete: “A row in public.profiles may be write when …”. If you need the SQL in front of you, you do not own the policy yet.

## profiles_update_self on public.profiles

**profiles_update_self**

```
CREATE POLICY profiles_update_self ON public.profiles FOR UPDATE TO authenticated
  USING ((id = auth.uid()) AND (is_disabled = false)) WITH CHECK (id = auth.uid());
```

This is a write rule. Ask: who is auth.uid()? Does the function is_admin / is_teacher_of_group / is_student_in_group / can_access_chat_room appear? If the policy is USING(true), it is a red flag unless the table is harmless.

> **CHECKPOINT — Say profiles_update_self aloud**
> Complete: “A row in public.profiles may be write when …”. If you need the SQL in front of you, you do not own the policy yet.

## profiles_select on public.profiles

**profiles_select**

```
CREATE POLICY profiles_select ON public.profiles FOR SELECT TO authenticated USING (
  (id = auth.uid()) OR is_admin() OR (EXISTS (
    SELECT 1 FROM (((teachers t
      JOIN groups g ON ((g.teacher_id = t.id)))
      JOIN group_students gs ON ((gs.group_id = g.id)))
      JOIN students st ON ((st.id = gs.student_id)))
    WHERE ((t.profile_id = auth.uid()) AND (st.profile_id = profiles.id))
  ))
);
```

This is a read rule. Ask: who is auth.uid()? Does the function is_admin / is_teacher_of_group / is_student_in_group / can_access_chat_room appear? If the policy is USING(true), it is a red flag unless the table is harmless.

> **CHECKPOINT — Say profiles_select aloud**
> Complete: “A row in public.profiles may be read when …”. If you need the SQL in front of you, you do not own the policy yet.

## profiles_select_groupmates on public.profiles

**profiles_select_groupmates**

```
CREATE POLICY profiles_select_groupmates ON public.profiles FOR SELECT TO authenticated USING (
  (EXISTS (
    SELECT 1 FROM (((group_students gs_self
      JOIN students s_self ON ((s_self.id = gs_self.student_id)))
      JOIN group_students gs_other ON ((gs_other.group_id = gs_self.group_id)))
      JOIN students s_other ON ((s_other.id = gs_other.student_id)))
    WHERE ((s_self.profile_id = auth.uid()) AND (s_other.profile_id = profiles.id))
  )) OR (EXISTS (
    SELECT 1 FROM (((group_students gs
      JOIN students s ON ((s.id = gs.student_id)))
      JOIN groups g ON ((g.id = gs.group_id)))
      JOIN teachers t ON ((t.id = g.teacher_id)))
    WHERE ((s.profile_id = auth.uid()) AND (t.profile_id = profiles.id))
  )) OR (EXISTS (
    SELECT 1 FROM (((teachers t
      JOIN groups g ON ((g.teacher_id = t.id)))
      JOIN group_students gs ON ((gs.group_id = g.id)))
      JOIN students s ON ((s.id = gs.student_id)))
    WHERE ((t.profile_id = auth.uid()) AND (s.profile_id = profiles.id))
  ))
);
```

This is a read rule. Ask: who is auth.uid()? Does the function is_admin / is_teacher_of_group / is_student_in_group / can_access_chat_room appear? If the policy is USING(true), it is a red flag unless the table is harmless.

> **CHECKPOINT — Say profiles_select_groupmates aloud**
> Complete: “A row in public.profiles may be read when …”. If you need the SQL in front of you, you do not own the policy yet.

## profiles_select_chat_message_senders on public.profiles

**profiles_select_chat_message_senders**

```
CREATE POLICY profiles_select_chat_message_senders ON public.profiles FOR SELECT TO
authenticated USING (
  EXISTS (
    SELECT 1 FROM chat_messages m
    WHERE ((m.sender_id = profiles.id) AND can_access_chat_room(m.room_id))
  )
);

-- teachers / students
```

This is a read rule. Ask: who is auth.uid()? Does the function is_admin / is_teacher_of_group / is_student_in_group / can_access_chat_room appear? If the policy is USING(true), it is a red flag unless the table is harmless.

> **CHECKPOINT — Say profiles_select_chat_message_senders aloud**
> Complete: “A row in public.profiles may be read when …”. If you need the SQL in front of you, you do not own the policy yet.

## teachers_admin on public.teachers

**teachers_admin**

```
CREATE POLICY teachers_admin ON public.teachers FOR ALL TO authenticated
  USING (is_admin()) WITH CHECK (is_admin());
```

This is a write rule. Ask: who is auth.uid()? Does the function is_admin / is_teacher_of_group / is_student_in_group / can_access_chat_room appear? If the policy is USING(true), it is a red flag unless the table is harmless.

> **CHECKPOINT — Say teachers_admin aloud**
> Complete: “A row in public.teachers may be write when …”. If you need the SQL in front of you, you do not own the policy yet.

## teachers_select on public.teachers

**teachers_select**

```
CREATE POLICY teachers_select ON public.teachers FOR SELECT TO authenticated USING (
  (profile_id = auth.uid()) OR is_admin() OR (current_profile_role() = 'student'::user_role)
);
```

This is a read rule. Ask: who is auth.uid()? Does the function is_admin / is_teacher_of_group / is_student_in_group / can_access_chat_room appear? If the policy is USING(true), it is a red flag unless the table is harmless.

> **CHECKPOINT — Say teachers_select aloud**
> Complete: “A row in public.teachers may be read when …”. If you need the SQL in front of you, you do not own the policy yet.

## students_admin on public.students

**students_admin**

```
CREATE POLICY students_admin ON public.students FOR ALL TO authenticated
  USING (is_admin()) WITH CHECK (is_admin());
```

This is a write rule. Ask: who is auth.uid()? Does the function is_admin / is_teacher_of_group / is_student_in_group / can_access_chat_room appear? If the policy is USING(true), it is a red flag unless the table is harmless.

> **CHECKPOINT — Say students_admin aloud**
> Complete: “A row in public.students may be write when …”. If you need the SQL in front of you, you do not own the policy yet.

## students_select on public.students

**students_select**

```
CREATE POLICY students_select ON public.students FOR SELECT TO authenticated USING (
  (profile_id = auth.uid()) OR is_admin() OR (current_profile_role() = 'teacher'::user_role)
);

-- groups
```

This is a read rule. Ask: who is auth.uid()? Does the function is_admin / is_teacher_of_group / is_student_in_group / can_access_chat_room appear? If the policy is USING(true), it is a red flag unless the table is harmless.

> **CHECKPOINT — Say students_select aloud**
> Complete: “A row in public.students may be read when …”. If you need the SQL in front of you, you do not own the policy yet.

## groups_select on public.groups

**groups_select**

```
CREATE POLICY groups_select ON public.groups FOR SELECT TO authenticated USING (
  is_teacher_of_group(id) OR is_student_in_group(id) OR is_admin()
);
```

This is a read rule. Ask: who is auth.uid()? Does the function is_admin / is_teacher_of_group / is_student_in_group / can_access_chat_room appear? If the policy is USING(true), it is a red flag unless the table is harmless.

> **CHECKPOINT — Say groups_select aloud**
> Complete: “A row in public.groups may be read when …”. If you need the SQL in front of you, you do not own the policy yet.

## groups_teacher_manage on public.groups

**groups_teacher_manage**

```
CREATE POLICY groups_teacher_manage ON public.groups FOR ALL TO authenticated
  USING (is_teacher_of_group(id) OR is_admin())
  WITH CHECK (is_teacher_of_group(id) OR is_admin());
```

This is a write rule. Ask: who is auth.uid()? Does the function is_admin / is_teacher_of_group / is_student_in_group / can_access_chat_room appear? If the policy is USING(true), it is a red flag unless the table is harmless.

> **CHECKPOINT — Say groups_teacher_manage aloud**
> Complete: “A row in public.groups may be write when …”. If you need the SQL in front of you, you do not own the policy yet.

## group_students_select on public.group_students

**group_students_select**

```
CREATE POLICY group_students_select ON public.group_students FOR SELECT TO authenticated USING (
  is_teacher_of_group(group_id) OR is_student_in_group(group_id) OR is_admin()
);
```

This is a read rule. Ask: who is auth.uid()? Does the function is_admin / is_teacher_of_group / is_student_in_group / can_access_chat_room appear? If the policy is USING(true), it is a red flag unless the table is harmless.

> **CHECKPOINT — Say group_students_select aloud**
> Complete: “A row in public.group_students may be read when …”. If you need the SQL in front of you, you do not own the policy yet.

## group_students_manage on public.group_students

**group_students_manage**

```
CREATE POLICY group_students_manage ON public.group_students FOR ALL TO authenticated
  USING (is_teacher_of_group(group_id) OR is_admin())
  WITH CHECK (is_teacher_of_group(group_id) OR is_admin());

-- assignments / tasks
```

This is a write rule. Ask: who is auth.uid()? Does the function is_admin / is_teacher_of_group / is_student_in_group / can_access_chat_room appear? If the policy is USING(true), it is a red flag unless the table is harmless.

> **CHECKPOINT — Say group_students_manage aloud**
> Complete: “A row in public.group_students may be write when …”. If you need the SQL in front of you, you do not own the policy yet.

## assignments_select on public.assignments

**assignments_select**

```
CREATE POLICY assignments_select ON public.assignments FOR SELECT TO authenticated USING (
  is_teacher_of_group(group_id) OR is_student_in_group(group_id) OR is_admin()
);
```

This is a read rule. Ask: who is auth.uid()? Does the function is_admin / is_teacher_of_group / is_student_in_group / can_access_chat_room appear? If the policy is USING(true), it is a red flag unless the table is harmless.

> **CHECKPOINT — Say assignments_select aloud**
> Complete: “A row in public.assignments may be read when …”. If you need the SQL in front of you, you do not own the policy yet.

## assignments_teacher on public.assignments

**assignments_teacher**

```
CREATE POLICY assignments_teacher ON public.assignments FOR ALL TO authenticated
  USING ((EXISTS (SELECT 1 FROM teachers t WHERE t.id = assignments.teacher_id AND t.profile_id
= auth.uid())) OR is_admin())
  WITH CHECK ((EXISTS (SELECT 1 FROM teachers t WHERE t.id = assignments.teacher_id AND t.
profile_id = auth.uid())) OR is_admin());
```

This is a write rule. Ask: who is auth.uid()? Does the function is_admin / is_teacher_of_group / is_student_in_group / can_access_chat_room appear? If the policy is USING(true), it is a red flag unless the table is harmless.

> **CHECKPOINT — Say assignments_teacher aloud**
> Complete: “A row in public.assignments may be write when …”. If you need the SQL in front of you, you do not own the policy yet.

## tasks_select on public.tasks

**tasks_select**

```
CREATE POLICY tasks_select ON public.tasks FOR SELECT TO authenticated USING (
  EXISTS (
    SELECT 1 FROM assignments a
    WHERE a.id = tasks.assignment_id
      AND (is_teacher_of_group(a.group_id) OR is_student_in_group(a.group_id) OR is_admin())
  )
);
```

This is a read rule. Ask: who is auth.uid()? Does the function is_admin / is_teacher_of_group / is_student_in_group / can_access_chat_room appear? If the policy is USING(true), it is a red flag unless the table is harmless.

> **CHECKPOINT — Say tasks_select aloud**
> Complete: “A row in public.tasks may be read when …”. If you need the SQL in front of you, you do not own the policy yet.

## tasks_teacher on public.tasks

**tasks_teacher**

```
CREATE POLICY tasks_teacher ON public.tasks FOR ALL TO authenticated
  USING ((EXISTS (
    SELECT 1 FROM (assignments a JOIN teachers t ON t.id = a.teacher_id)
    WHERE a.id = tasks.assignment_id AND t.profile_id = auth.uid()
  )) OR is_admin())
  WITH CHECK ((EXISTS (
    SELECT 1 FROM (assignments a JOIN teachers t ON t.id = a.teacher_id)
    WHERE a.id = tasks.assignment_id AND t.profile_id = auth.uid()
  )) OR is_admin());

-- submissions
```

This is a write rule. Ask: who is auth.uid()? Does the function is_admin / is_teacher_of_group / is_student_in_group / can_access_chat_room appear? If the policy is USING(true), it is a red flag unless the table is harmless.

> **CHECKPOINT — Say tasks_teacher aloud**
> Complete: “A row in public.tasks may be write when …”. If you need the SQL in front of you, you do not own the policy yet.

## submissions_select on public.submissions

**submissions_select**

```
CREATE POLICY submissions_select ON public.submissions FOR SELECT TO authenticated USING (
  (EXISTS (SELECT 1 FROM students s WHERE s.id = submissions.student_id AND s.profile_id = auth.
uid())))
  OR (EXISTS (
    SELECT 1 FROM (tasks tk JOIN assignments a ON a.id = tk.assignment_id)
    WHERE tk.id = submissions.task_id AND is_teacher_of_group(a.group_id)
  ))
  OR is_admin()
);
```

This is a read rule. Ask: who is auth.uid()? Does the function is_admin / is_teacher_of_group / is_student_in_group / can_access_chat_room appear? If the policy is USING(true), it is a red flag unless the table is harmless.

> **CHECKPOINT — Say submissions_select aloud**
> Complete: “A row in public.submissions may be read when …”. If you need the SQL in front of you, you do not own the policy yet.

## submissions_student on public.submissions

**submissions_student**

```
CREATE POLICY submissions_student ON public.submissions FOR ALL TO authenticated
```

```
  USING (EXISTS (SELECT 1 FROM students s WHERE s.id = submissions.student_id AND s.profile_id
 = auth.uid()))
  WITH CHECK (EXISTS (SELECT 1 FROM students s WHERE s.id = submissions.student_id AND s.
profile_id = auth.uid()));
```

This is a write rule. Ask: who is auth.uid()? Does the function is_admin / is_teacher_of_group / is_student_in_group / can_access_chat_room appear? If the policy is USING(true), it is a red flag unless the table is harmless.

> **CHECKPOINT — Say submissions_student aloud**
> Complete: “A row in public.submissions may be write when …”. If you need the SQL in front of you, you do not own the policy yet.

## submissions_teacher_update on public.submissions

**submissions_teacher_update**

```
CREATE POLICY submissions_teacher_update ON public.submissions FOR UPDATE TO authenticated
  USING ((EXISTS (
    SELECT 1 FROM (tasks tk JOIN assignments a ON a.id = tk.assignment_id)
    WHERE tk.id = submissions.task_id AND is_teacher_of_group(a.group_id)
  )) OR is_admin())
  WITH CHECK ((EXISTS (
    SELECT 1 FROM (tasks tk JOIN assignments a ON a.id = tk.assignment_id)
    WHERE tk.id = submissions.task_id AND is_teacher_of_group(a.group_id)
  )) OR is_admin());

-- attendance / sessions
```

This is a write rule. Ask: who is auth.uid()? Does the function is_admin / is_teacher_of_group / is_student_in_group / can_access_chat_room appear? If the policy is USING(true), it is a red flag unless the table is harmless.

> **CHECKPOINT — Say submissions_teacher_update aloud**
> Complete: “A row in public.submissions may be write when …”. If you need the SQL in front of you, you do not own the policy yet.

## attendance_select on public.attendance

**attendance_select**

```
CREATE POLICY attendance_select ON public.attendance FOR SELECT TO authenticated USING (
  is_teacher_of_group(group_id) OR is_student_in_group(group_id) OR is_admin()
);
```

This is a read rule. Ask: who is auth.uid()? Does the function is_admin / is_teacher_of_group / is_student_in_group / can_access_chat_room appear? If the policy is USING(true), it is a red flag unless the table is harmless.

> **CHECKPOINT — Say attendance_select aloud**
> Complete: “A row in public.attendance may be read when …”. If you need the SQL in front of you, you do not own the policy yet.

## attendance_teacher on public.attendance

**attendance_teacher**

```
CREATE POLICY attendance_teacher ON public.attendance FOR ALL TO authenticated
  USING (is_teacher_of_group(group_id) OR is_admin())
  WITH CHECK (is_teacher_of_group(group_id) OR is_admin());
```

This is a write rule. Ask: who is auth.uid()? Does the function is_admin / is_teacher_of_group / is_student_in_group / can_access_chat_room appear? If the policy is USING(true), it is a red flag unless the table is harmless.

> **CHECKPOINT — Say attendance_teacher aloud**
> Complete: “A row in public.attendance may be write when …”. If you need the SQL in front of you, you do not own the policy yet.

## lesson_sessions_select on public.lesson_sessions

**lesson_sessions_select**

```
CREATE POLICY lesson_sessions_select ON public.lesson_sessions FOR SELECT TO authenticated
USING (
  is_teacher_of_group(group_id) OR is_student_in_group(group_id) OR is_admin()
);
```

This is a read rule. Ask: who is auth.uid()? Does the function is_admin / is_teacher_of_group / is_student_in_group / can_access_chat_room appear? If the policy is USING(true), it is a red flag unless the table is harmless.

> **CHECKPOINT — Say lesson_sessions_select aloud**
> Complete: “A row in public.lesson_sessions may be read when …”. If you need the SQL in front of you, you do not own the policy yet.

## lesson_sessions_manage on public.lesson_sessions

**lesson_sessions_manage**

```
CREATE POLICY lesson_sessions_manage ON public.lesson_sessions FOR ALL TO authenticated
  USING (is_teacher_of_group(group_id) OR is_admin())
  WITH CHECK (is_teacher_of_group(group_id) OR is_admin());

-- marks
```

This is a write rule. Ask: who is auth.uid()? Does the function is_admin / is_teacher_of_group / is_student_in_group / can_access_chat_room appear? If the policy is USING(true), it is a red flag unless the table is harmless.

> **CHECKPOINT — Say lesson_sessions_manage aloud**
> Complete: “A row in public.lesson_sessions may be write when …”. If you need the SQL in front of you, you do not own the policy yet.

## marks_select on public.marks

**marks_select**

```
CREATE POLICY marks_select ON public.marks FOR SELECT TO authenticated USING (
  (EXISTS (SELECT 1 FROM students s WHERE s.id = marks.student_id AND s.profile_id = auth.uid(
)))
  OR is_teacher_of_group(group_id) OR is_admin()
);
```

This is a read rule. Ask: who is auth.uid()? Does the function is_admin / is_teacher_of_group / is_student_in_group / can_access_chat_room appear? If the policy is USING(true), it is a red flag unless the table is harmless.

> **CHECKPOINT — Say marks_select aloud**
> Complete: “A row in public.marks may be read when …”. If you need the SQL in front of you, you do not own the policy yet.

## marks_teacher_manage on public.marks

**marks_teacher_manage**

```
CREATE POLICY marks_teacher_manage ON public.marks FOR ALL TO authenticated
  USING (is_teacher_of_group(group_id) OR is_admin())
  WITH CHECK (is_teacher_of_group(group_id) OR is_admin());

-- announcements / templates / notifications
```

This is a write rule. Ask: who is auth.uid()? Does the function is_admin / is_teacher_of_group / is_student_in_group / can_access_chat_room appear? If the policy is USING(true), it is a red flag unless the table is harmless.

> **CHECKPOINT — Say marks_teacher_manage aloud**
> Complete: “A row in public.marks may be write when …”. If you need the SQL in front of you, you do not own the policy yet.

## announcements_select on public.announcements

**announcements_select**

```
CREATE POLICY announcements_select ON public.announcements FOR SELECT TO authenticated USING (
  is_teacher_of_group(group_id) OR is_student_in_group(group_id) OR is_admin()
);
```

This is a read rule. Ask: who is auth.uid()? Does the function is_admin / is_teacher_of_group / is_student_in_group / can_access_chat_room appear? If the policy is USING(true), it is a red flag unless the table is harmless.

> **CHECKPOINT — Say announcements_select aloud**
> Complete: “A row in public.announcements may be read when …”. If you need the SQL in front of you, you do not own the policy yet.

## announcements_teacher on public.announcements

**announcements_teacher**

```
CREATE POLICY announcements_teacher ON public.announcements FOR ALL TO authenticated
  USING ((EXISTS (SELECT 1 FROM teachers t WHERE t.id = announcements.teacher_id AND t.
profile_id = auth.uid())) OR is_admin())
  WITH CHECK ((EXISTS (SELECT 1 FROM teachers t WHERE t.id = announcements.teacher_id AND t.
profile_id = auth.uid())) OR is_admin());
```

This is a write rule. Ask: who is auth.uid()? Does the function is_admin / is_teacher_of_group / is_student_in_group / can_access_chat_room appear? If the policy is USING(true), it is a red flag unless the table is harmless.

> **CHECKPOINT — Say announcements_teacher aloud**
> Complete: “A row in public.announcements may be write when …”. If you need the SQL in front of you, you do not own the policy yet.

## assignment_templates_teacher on public.assignment_templates

**assignment_templates_teacher**

```
CREATE POLICY assignment_templates_teacher ON public.assignment_templates FOR ALL TO
authenticated
  USING ((EXISTS (SELECT 1 FROM teachers t WHERE t.id = assignment_templates.teacher_id AND t.
profile_id = auth.uid())) OR is_admin())
  WITH CHECK ((EXISTS (SELECT 1 FROM teachers t WHERE t.id = assignment_templates.teacher_id
AND t.profile_id = auth.uid())) OR is_admin());
```

This is a write rule. Ask: who is auth.uid()? Does the function is_admin / is_teacher_of_group / is_student_in_group / can_access_chat_room appear? If the policy is USING(true), it is a red flag unless the table is harmless.

> **CHECKPOINT — Say assignment_templates_teacher aloud**
> Complete: “A row in public.assignment_templates may be write when …”. If you need the SQL in front of you, you do not own the policy yet.

## notifications_own on public.notifications

**notifications_own**

```
CREATE POLICY notifications_own ON public.notifications FOR ALL TO authenticated
  USING (user_id = auth.uid()) WITH CHECK (user_id = auth.uid());

-- academic
```

This is a write rule. Ask: who is auth.uid()? Does the function is_admin / is_teacher_of_group / is_student_in_group / can_access_chat_room appear? If the policy is USING(true), it is a red flag unless the table is harmless.

> **CHECKPOINT — Say notifications_own aloud**
> Complete: “A row in public.notifications may be write when …”. If you need the SQL in front of you, you do not own the policy yet.

## academic_years_select on public.academic_years

**academic_years_select**

```
CREATE POLICY academic_years_select ON public.academic_years FOR SELECT TO authenticated USING (
true);
```

This is a read rule. Ask: who is auth.uid()? Does the function is_admin / is_teacher_of_group / is_student_in_group / can_access_chat_room appear? If the policy is USING(true), it is a red flag unless the table is harmless.

> **CHECKPOINT — Say academic_years_select aloud**
> Complete: “A row in public.academic_years may be read when …”. If you need the SQL in front of you, you do not own the policy yet.

## academic_years_admin on public.academic_years

**academic_years_admin**

```
CREATE POLICY academic_years_admin ON public.academic_years FOR ALL TO authenticated
  USING (is_admin()) WITH CHECK (is_admin());
```

This is a write rule. Ask: who is auth.uid()? Does the function is_admin / is_teacher_of_group / is_student_in_group / can_access_chat_room appear? If the policy is USING(true), it is a red flag unless the table is harmless.

> **CHECKPOINT — Say academic_years_admin aloud**
> Complete: “A row in public.academic_years may be write when …”. If you need the SQL in front of you, you do not own the policy yet.

## academic_terms_select on public.academic_terms

**academic_terms_select**

```
CREATE POLICY academic_terms_select ON public.academic_terms FOR SELECT TO authenticated USING (
true);
```

This is a read rule. Ask: who is auth.uid()? Does the function is_admin / is_teacher_of_group / is_student_in_group / can_access_chat_room appear? If the policy is USING(true), it is a red flag unless the table is harmless.

> **CHECKPOINT — Say academic_terms_select aloud**
> Complete: “A row in public.academic_terms may be read when …”. If you need the SQL in front of you, you do not own the policy yet.

## academic_terms_admin on public.academic_terms

**academic_terms_admin**

```
CREATE POLICY academic_terms_admin ON public.academic_terms FOR ALL TO authenticated
  USING (is_admin()) WITH CHECK (is_admin());

-- chat
```

This is a write rule. Ask: who is auth.uid()? Does the function is_admin / is_teacher_of_group / is_student_in_group / can_access_chat_room appear? If the policy is USING(true), it is a red flag unless the table is harmless.

> **CHECKPOINT — Say academic_terms_admin aloud**
> Complete: “A row in public.academic_terms may be write when …”. If you need the SQL in front of you, you do not own the policy yet.

## chat_rooms_select on public.chat_rooms

**chat_rooms_select**

```
CREATE POLICY chat_rooms_select ON public.chat_rooms FOR SELECT TO authenticated
  USING (can_access_chat_room(id));
```

This is a read rule. Ask: who is auth.uid()? Does the function is_admin / is_teacher_of_group / is_student_in_group / can_access_chat_room appear? If the policy is USING(true), it is a red flag unless the table is harmless.

> **CHECKPOINT — Say chat_rooms_select aloud**
> Complete: “A row in public.chat_rooms may be read when …”. If you need the SQL in front of you, you do not own the policy yet.

## chat_rooms_admin_insert on public.chat_rooms

**chat_rooms_admin_insert**

```
CREATE POLICY chat_rooms_admin_insert ON public.chat_rooms FOR INSERT TO authenticated
  WITH CHECK (is_admin() OR is_teacher_of_group(group_id));
```

This is a write rule. Ask: who is auth.uid()? Does the function is_admin / is_teacher_of_group / is_student_in_group / can_access_chat_room appear? If the policy is USING(true), it is a red flag unless the table is harmless.

> **CHECKPOINT — Say chat_rooms_admin_insert aloud**
> Complete: “A row in public.chat_rooms may be write when …”. If you need the SQL in front of you, you do not own the policy yet.

## chat_messages_select on public.chat_messages

**chat_messages_select**

```
CREATE POLICY chat_messages_select ON public.chat_messages FOR SELECT TO authenticated
  USING (can_access_chat_room(room_id));
```

This is a read rule. Ask: who is auth.uid()? Does the function is_admin / is_teacher_of_group / is_student_in_group / can_access_chat_room appear? If the policy is USING(true), it is a red flag unless the table is harmless.

> **CHECKPOINT — Say chat_messages_select aloud**
> Complete: “A row in public.chat_messages may be read when …”. If you need the SQL in front of you, you do not own the policy yet.

## chat_messages_insert on public.chat_messages

**chat_messages_insert**

```
CREATE POLICY chat_messages_insert ON public.chat_messages FOR INSERT TO authenticated
  WITH CHECK ((sender_id = auth.uid()) AND can_access_chat_room(room_id));
```

This is a write rule. Ask: who is auth.uid()? Does the function is_admin / is_teacher_of_group / is_student_in_group / can_access_chat_room appear? If the policy is USING(true), it is a red flag unless the table is harmless.

> **CHECKPOINT — Say chat_messages_insert aloud**
> Complete: “A row in public.chat_messages may be write when …”. If you need the SQL in front of you, you do not own the policy yet.

## chat_messages_update on public.chat_messages

**chat_messages_update**

```
CREATE POLICY chat_messages_update ON public.chat_messages FOR UPDATE TO authenticated
  USING (is_admin() OR ((sender_id = auth.uid()) AND can_access_chat_room(room_id)))
  WITH CHECK (is_admin() OR ((sender_id = auth.uid()) AND can_access_chat_room(room_id)));
```

This is a write rule. Ask: who is auth.uid()? Does the function is_admin / is_teacher_of_group / is_student_in_group / can_access_chat_room appear? If the policy is USING(true), it is a red flag unless the table is harmless.

> **CHECKPOINT — Say chat_messages_update aloud**
> Complete: “A row in public.chat_messages may be write when …”. If you need the SQL in front of you, you do not own the policy yet.

## chat_messages_delete on public.chat_messages

**chat_messages_delete**

```
CREATE POLICY chat_messages_delete ON public.chat_messages FOR DELETE TO authenticated
  USING (is_admin() OR ((sender_id = auth.uid()) AND can_access_chat_room(room_id)));
```

This is a mixed rule. Ask: who is auth.uid()? Does the function is_admin / is_teacher_of_group / is_student_in_group / can_access_chat_room appear? If the policy is USING(true), it is a red flag unless the table is harmless.

> **CHECKPOINT — Say chat_messages_delete aloud**
> Complete: “A row in public.chat_messages may be mixed when …”. If you need the SQL in front of you, you do not own the policy yet.

## message_reads_select on public.message_reads

**message_reads_select**

```
CREATE POLICY message_reads_select ON public.message_reads FOR SELECT TO authenticated USING (
  (user_id = auth.uid()) OR is_admin() OR (EXISTS (
    SELECT 1 FROM chat_messages m WHERE m.id = message_reads.message_id AND
can_access_chat_room(m.room_id)
  ))
);
```

This is a read rule. Ask: who is auth.uid()? Does the function is_admin / is_teacher_of_group / is_student_in_group / can_access_chat_room appear? If the policy is USING(true), it is a red flag unless the table is harmless.

> **CHECKPOINT — Say message_reads_select aloud**
> Complete: “A row in public.message_reads may be read when …”. If you need the SQL in front of you, you do not own the policy yet.

## message_reads_insert on public.message_reads

**message_reads_insert**

```
CREATE POLICY message_reads_insert ON public.message_reads FOR INSERT TO authenticated
  WITH CHECK ((user_id = auth.uid()) AND (EXISTS (
    SELECT 1 FROM chat_messages m WHERE m.id = message_reads.message_id AND
can_access_chat_room(m.room_id)
  )));
```

This is a write rule. Ask: who is auth.uid()? Does the function is_admin / is_teacher_of_group / is_student_in_group / can_access_chat_room appear? If the policy is USING(true), it is a red flag unless the table is harmless.

> **CHECKPOINT — Say message_reads_insert aloud**
> Complete: “A row in public.message_reads may be write when …”. If you need the SQL in front of you, you do not own the policy yet.

## message_reads_delete on public.message_reads

**message_reads_delete**

```
CREATE POLICY message_reads_delete ON public.message_reads FOR DELETE TO authenticated
  USING ((user_id = auth.uid()) OR is_admin());
```

This is a mixed rule. Ask: who is auth.uid()? Does the function is_admin / is_teacher_of_group / is_student_in_group / can_access_chat_room appear? If the policy is USING(true), it is a red flag unless the table is harmless.

> **CHECKPOINT — Say message_reads_delete aloud**
> Complete: "A row in public.message_reads may be mixed when …". If you need the SQL in front of you, you do not own the policy yet.

## message_reactions_select on public.message_reactions

**message_reactions_select**

```
CREATE POLICY message_reactions_select ON public.message_reactions FOR SELECT TO authenticated
USING (
  EXISTS (SELECT 1 FROM chat_messages m WHERE m.id = message_reactions.message_id AND
can_access_chat_room(m.room_id))
);
```

This is a read rule. Ask: who is auth.uid()? Does the function is_admin / is_teacher_of_group / is_student_in_group / can_access_chat_room appear? If the policy is USING(true), it is a red flag unless the table is harmless.

> **CHECKPOINT — Say message_reactions_select aloud**
> Complete: "A row in public.message_reactions may be read when …". If you need the SQL in front of you, you do not own the policy yet.

## message_reactions_insert on public.message_reactions

**message_reactions_insert**

```
CREATE POLICY message_reactions_insert ON public.message_reactions FOR INSERT TO authenticated
  WITH CHECK ((user_id = auth.uid()) AND (EXISTS (
    SELECT 1 FROM chat_messages m
    WHERE m.id = message_reactions.message_id AND m.is_deleted = false AND can_access_chat_room(
m.room_id)
  )));
```

This is a write rule. Ask: who is auth.uid()? Does the function is_admin / is_teacher_of_group / is_student_in_group / can_access_chat_room appear? If the policy is USING(true), it is a red flag unless the table is harmless.

> **CHECKPOINT — Say message_reactions_insert aloud**
> Complete: "A row in public.message_reactions may be write when …". If you need the SQL in front of you, you do not own the policy yet.

## message_reactions_update on public.message_reactions

**message_reactions_update**

```
CREATE POLICY message_reactions_update ON public.message_reactions FOR UPDATE TO authenticated
  USING (user_id = auth.uid()) WITH CHECK (user_id = auth.uid());
```

This is a write rule. Ask: who is auth.uid()? Does the function is_admin / is_teacher_of_group / is_student_in_group / can_access_chat_room appear? If the policy is USING(true), it is a red flag unless the table is harmless.

> **CHECKPOINT — Say message_reactions_update aloud**
> Complete: “A row in public.message_reactions may be write when …”. If you need the SQL in front of you, you do not own the policy yet.

## message_reactions_delete on public.message_reactions

**message_reactions_delete**

```
CREATE POLICY message_reactions_delete ON public.message_reactions FOR DELETE TO authenticated
  USING ((user_id = auth.uid()) OR is_admin());
```

This is a mixed rule. Ask: who is auth.uid()? Does the function is_admin / is_teacher_of_group / is_student_in_group / can_access_chat_room appear? If the policy is USING(true), it is a red flag unless the table is harmless.

> **CHECKPOINT — Say message_reactions_delete aloud**
> Complete: “A row in public.message_reactions may be mixed when …”. If you need the SQL in front of you, you do not own the policy yet.

# 30-day rebuild journal

If you work one day at a time, this journal is your calendar. Each day ends with a written proof (screenshot, SQL result, or test output). Days are not optional snacks — they are the same 30 tutorials in calendar form.

## Day 01 — Product walk

**Work:** Tutorial 1 screenshots. Write the three roles from memory.

Morning: read the tutorial without touching the keyboard. Write three questions. Afternoon: do the TASK. Evening: run the CHECKPOINT and paste the proof into your private notes file. If the checkpoint fails, do not start the next day — use Appendix D.

Reflection prompts: What object did you create today (table, widget, provider)? What would a student see if you shipped only through today? What secret did you almost put in git?

> **CHECKPOINT — Day 1 done**
> You have an artifact (file, query, screenshot) dated today. Tomorrow-you can reproduce the step from that artifact without this paragraph.

## Day 02 — ER diagram

**Work:** Tutorial 2. Circle profile id vs student id.

Morning: read the tutorial without touching the keyboard. Write three questions. Afternoon: do the TASK. Evening: run the CHECKPOINT and paste the proof into your private notes file. If the checkpoint fails, do not start the next day — use Appendix D.

Reflection prompts: What object did you create today (table, widget, provider)? What would a student see if you shipped only through today? What secret did you almost put in git?

> **CHECKPOINT — Day 2 done**
> You have an artifact (file, query, screenshot) dated today. Tomorrow-you can reproduce the step from that artifact without this paragraph.

## Day 03 — Supabase project

**Work:** Tutorial 3. URL + anon key in private notes.

Morning: read the tutorial without touching the keyboard. Write three questions. Afternoon: do the TASK. Evening: run the CHECKPOINT and paste the proof into your private notes file. If the checkpoint fails, do not start the next day — use Appendix D.

Reflection prompts: What object did you create today (table, widget, provider)? What would a student see if you shipped only through today? What secret did you almost put in git?

> **CHECKPOINT — Day 3 done**
> You have an artifact (file, query, screenshot) dated today. Tomorrow-you can reproduce the step from that artifact without this paragraph.

## Day 04 — .env + SetupRequired A/B

**Work:** Tutorial 4.

Morning: read the tutorial without touching the keyboard. Write three questions. Afternoon: do the TASK. Evening: run the CHECKPOINT and paste the proof into your private notes file. If the checkpoint fails, do not start the next day — use Appendix D.

Reflection prompts: What object did you create today (table, widget, provider)? What would a student see if you shipped only through today? What secret did you almost put in git?

> **CHECKPOINT — Day 4 done**
> You have an artifact (file, query, screenshot) dated today. Tomorrow-you can reproduce the step from that artifact without this paragraph.

## Day 05 — flutter create / tree

**Work:** Tutorial 5. pub get.

Morning: read the tutorial without touching the keyboard. Write three questions. Afternoon: do the TASK. Evening: run the CHECKPOINT and paste the proof into your private notes file. If the checkpoint fails, do not start the next day — use Appendix D.

Reflection prompts: What object did you create today (table, widget, provider)? What would a student see if you shipped only through today? What secret did you almost put in git?

> **CHECKPOINT — Day 5 done**
> You have an artifact (file, query, screenshot) dated today. Tomorrow-you can reproduce the step from that artifact without this paragraph.

## Day 06 — Dart drills

**Work:** Tutorial 6 tests.

Morning: read the tutorial without touching the keyboard. Write three questions. Afternoon: do the TASK. Evening: run the CHECKPOINT and paste the proof into your private notes file. If the checkpoint fails, do not start the next day — use Appendix D.

Reflection prompts: What object did you create today (table, widget, provider)? What would a student see if you shipped only through today? What secret did you almost put in git?

> **CHECKPOINT — Day 6 done**
> You have an artifact (file, query, screenshot) dated today. Tomorrow-you can reproduce the step from that artifact without this paragraph.

## Day 07 — Practice login UI

**Work:** Tutorial 7.

Morning: read the tutorial without touching the keyboard. Write three questions. Afternoon: do the TASK. Evening: run the CHECKPOINT and paste the proof into your private notes file. If the checkpoint fails, do not start the next day — use Appendix D.

Reflection prompts: What object did you create today (table, widget, provider)? What would a student see if you shipped only through today? What secret did you almost put in git?

> **CHECKPOINT — Day 7 done**
> You have an artifact (file, query, screenshot) dated today. Tomorrow-you can reproduce the step from that artifact without this paragraph.

## Day 08 — Todo State vs Riverpod note

**Work:** Tutorial 8.

Morning: read the tutorial without touching the keyboard. Write three questions. Afternoon: do the TASK. Evening: run the CHECKPOINT and paste the proof into your private notes file. If the checkpoint fails, do not start the next day — use Appendix D.

Reflection prompts: What object did you create today (table, widget, provider)? What would a student see if you shipped only through today? What secret did you almost put in git?

> **CHECKPOINT — Day 8 done**
> You have an artifact (file, query, screenshot) dated today. Tomorrow-you can reproduce the step from that artifact without this paragraph.

## Day 09 — Redirect trace on paper

**Work:** Tutorial 9.

Morning: read the tutorial without touching the keyboard. Write three questions. Afternoon: do the TASK. Evening: run the CHECKPOINT and paste the proof into your private notes file. If the checkpoint fails, do not start the next day — use Appendix D.

Reflection prompts: What object did you create today (table, widget, provider)? What would a student see if you shipped only through today? What secret did you almost put in git?

> **CHECKPOINT — Day 9 done**
> You have an artifact (file, query, screenshot) dated today. Tomorrow-you can reproduce the step from that artifact without this paragraph.

## Day 10 — Counter + FutureProvider lab

**Work:** Tutorial 10.

Morning: read the tutorial without touching the keyboard. Write three questions. Afternoon: do the TASK. Evening: run the CHECKPOINT and paste the proof into your private notes file. If the checkpoint fails, do not start the next day — use Appendix D.

Reflection prompts: What object did you create today (table, widget, provider)? What would a student see if you shipped only through today? What secret did you almost put in git?

> **CHECKPOINT — Day 10 done**
> You have an artifact (file, query, screenshot) dated today. Tomorrow-you can reproduce the step from that artifact without this paragraph.

## Day 11 — homework_pack mapping test

**Work:** Tutorial 11.

Morning: read the tutorial without touching the keyboard. Write three questions. Afternoon: do the TASK. Evening: run the CHECKPOINT and paste the proof into your private notes file. If the checkpoint fails, do not start the next day — use Appendix D.

Reflection prompts: What object did you create today (table, widget, provider)? What would a student see if you shipped only through today? What secret did you almost put in git?

> **CHECKPOINT — Day 11 done**
> You have an artifact (file, query, screenshot) dated today. Tomorrow-you can reproduce the step from that artifact without this paragraph.

## Day 12 — SQL joins in SQL Editor

**Work:** Tutorial 12.

Morning: read the tutorial without touching the keyboard. Write three questions. Afternoon: do the TASK. Evening: run the CHECKPOINT and paste the proof into your private notes file. If the checkpoint fails, do not start the next day — use Appendix D.

Reflection prompts: What object did you create today (table, widget, provider)? What would a student see if you shipped only through today? What secret did you almost put in git?

> **CHECKPOINT — Day 12 done**
> You have an artifact (file, query, screenshot) dated today. Tomorrow-you can reproduce the step from that artifact without this paragraph.

## Day 13 — First admin + login

**Work:** Tutorial 13.

Morning: read the tutorial without touching the keyboard. Write three questions. Afternoon: do the TASK. Evening: run the CHECKPOINT and paste the proof into your private notes file. If the checkpoint fails, do not start the next day — use Appendix D.

Reflection prompts: What object did you create today (table, widget, provider)? What would a student see if you shipped only through today? What secret did you almost put in git?

> **CHECKPOINT — Day 13 done**
> You have an artifact (file, query, screenshot) dated today. Tomorrow-you can reproduce the step from that artifact without this paragraph.

## Day 14 — Trace three .from() calls

**Work:** Tutorial 14.

Morning: read the tutorial without touching the keyboard. Write three questions. Afternoon: do the TASK. Evening: run the CHECKPOINT and paste the proof into your private notes file. If the checkpoint fails, do not start the next day — use Appendix D.

Reflection prompts: What object did you create today (table, widget, provider)? What would a student see if you shipped only through today? What secret did you almost put in git?

> **CHECKPOINT — Day 14 done**
> You have an artifact (file, query, screenshot) dated today. Tomorrow-you can reproduce the step from that artifact without this paragraph.

## Day 15 — Two-student marks RLS

**Work:** Tutorial 15.

Morning: read the tutorial without touching the keyboard. Write three questions. Afternoon: do the TASK. Evening: run the CHECKPOINT and paste the proof into your private notes file. If the checkpoint fails, do not start the next day — use Appendix D.

Reflection prompts: What object did you create today (table, widget, provider)? What would a student see if you shipped only through today? What secret did you almost put in git?

> **CHECKPOINT — Day 15 done**
> You have an artifact (file, query, screenshot) dated today. Tomorrow-you can reproduce the step from that artifact without this paragraph.

## Day 16 — Homework file upload

**Work:** Tutorial 16.

Morning: read the tutorial without touching the keyboard. Write three questions. Afternoon: do the TASK. Evening: run the CHECKPOINT and paste the proof into your private notes file. If the checkpoint fails, do not start the next day — use Appendix D.

Reflection prompts: What object did you create today (table, widget, provider)? What would a student see if you shipped only through today? What secret did you almost put in git?

> **CHECKPOINT — Day 16 done**
> You have an artifact (file, query, screenshot) dated today. Tomorrow-you can reproduce the step from that artifact without this paragraph.

## Day 17 — Two-device chat

**Work:** Tutorial 17.

Morning: read the tutorial without touching the keyboard. Write three questions. Afternoon: do the TASK. Evening: run the CHECKPOINT and paste the proof into your private notes file. If the checkpoint fails, do not start the next day — use Appendix D.

Reflection prompts: What object did you create today (table, widget, provider)? What would a student see if you shipped only through today? What secret did you almost put in git?

> **CHECKPOINT — Day 17 done**
> You have an artifact (file, query, screenshot) dated today. Tomorrow-you can reproduce the step from that artifact without this paragraph.

## Day 18 — RU + UZ switch

**Work:** Tutorial 18.

Morning: read the tutorial without touching the keyboard. Write three questions. Afternoon: do the TASK. Evening: run the CHECKPOINT and paste the proof into your private notes file. If the checkpoint fails, do not start the next day — use Appendix D.

Reflection prompts: What object did you create today (table, widget, provider)? What would a student see if you shipped only through today? What secret did you almost put in git?

> **CHECKPOINT — Day 18 done**
> You have an artifact (file, query, screenshot) dated today. Tomorrow-you can reproduce the step from that artifact without this paragraph.

## Day 19 — Four styles × dark

**Work:** Tutorial 19.

Morning: read the tutorial without touching the keyboard. Write three questions. Afternoon: do the TASK. Evening: run the CHECKPOINT and paste the proof into your private notes file. If the checkpoint fails, do not start the next day — use Appendix D.

Reflection prompts: What object did you create today (table, widget, provider)? What would a student see if you shipped only through today? What secret did you almost put in git?

> **CHECKPOINT — Day 19 done**
> You have an artifact (file, query, screenshot) dated today. Tomorrow-you can reproduce the step from that artifact without this paragraph.

## Day 20 — Assignment notify inbox

**Work:** Tutorial 20.

Morning: read the tutorial without touching the keyboard. Write three questions. Afternoon: do the TASK. Evening: run the CHECKPOINT and paste the proof into your private notes file. If the checkpoint fails, do not start the next day — use Appendix D.

Reflection prompts: What object did you create today (table, widget, provider)? What would a student see if you shipped only through today? What secret did you almost put in git?

> **CHECKPOINT — Day 20 done**
> You have an artifact (file, query, screenshot) dated today. Tomorrow-you can reproduce the step from that artifact without this paragraph.

## Day 21 — Full auth loop freeze-test

**Work:** Tutorial 21.

Morning: read the tutorial without touching the keyboard. Write three questions. Afternoon: do the TASK. Evening: run the CHECKPOINT and paste the proof into your private notes file. If the checkpoint fails, do not start the next day — use Appendix D.

Reflection prompts: What object did you create today (table, widget, provider)? What would a student see if you shipped only through today? What secret did you almost put in git?

> **CHECKPOINT — Day 21 done**
> You have an artifact (file, query, screenshot) dated today. Tomorrow-you can reproduce the step from that artifact without this paragraph.

## Day 22 — Pack create → submit → grade

**Work:** Tutorial 22.

Morning: read the tutorial without touching the keyboard. Write three questions. Afternoon: do the TASK. Evening: run the CHECKPOINT and paste the proof into your private notes file. If the checkpoint fails, do not start the next day — use Appendix D.

Reflection prompts: What object did you create today (table, widget, provider)? What would a student see if you shipped only through today? What secret did you almost put in git?

> **CHECKPOINT — Day 22 done**
> You have an artifact (file, query, screenshot) dated today. Tomorrow-you can reproduce the step from that artifact without this paragraph.

## Day 23 — Reactions + unread

**Work:** Tutorial 23.

Morning: read the tutorial without touching the keyboard. Write three questions. Afternoon: do the TASK. Evening: run the CHECKPOINT and paste the proof into your private notes file. If the checkpoint fails, do not start the next day — use Appendix D.

Reflection prompts: What object did you create today (table, widget, provider)? What would a student see if you shipped only through today? What secret did you almost put in git?

> **CHECKPOINT — Day 23 done**
> You have an artifact (file, query, screenshot) dated today. Tomorrow-you can reproduce the step from that artifact without this paragraph.

## Day 24 — Attendance unique session

**Work:** Tutorial 24.

Morning: read the tutorial without touching the keyboard. Write three questions. Afternoon: do the TASK. Evening: run the CHECKPOINT and paste the proof into your private notes file. If the checkpoint fails, do not start the next day — use Appendix D.

Reflection prompts: What object did you create today (table, widget, provider)? What would a student see if you shipped only through today? What secret did you almost put in git?

> **CHECKPOINT — Day 24 done**
> You have an artifact (file, query, screenshot) dated today. Tomorrow-you can reproduce the step from that artifact without this paragraph.

## Day 25 — Announcement + out-of-group deny

**Work:** Tutorial 25.

Morning: read the tutorial without touching the keyboard. Write three questions. Afternoon: do the TASK. Evening: run the CHECKPOINT and paste the proof into your private notes file. If the checkpoint fails, do not start the next day — use Appendix D.

Reflection prompts: What object did you create today (table, widget, provider)? What would a student see if you shipped only through today? What secret did you almost put in git?

> **CHECKPOINT — Day 25 done**
> You have an artifact (file, query, screenshot) dated today. Tomorrow-you can reproduce the step from that artifact without this paragraph.

## Day 26 — Component inventory

**Work:** Tutorial 26.

Morning: read the tutorial without touching the keyboard. Write three questions. Afternoon: do the TASK. Evening: run the CHECKPOINT and paste the proof into your private notes file. If the checkpoint fails, do not start the next day — use Appendix D.

Reflection prompts: What object did you create today (table, widget, provider)? What would a student see if you shipped only through today? What secret did you almost put in git?

> **CHECKPOINT — Day 26 done**
> You have an artifact (file, query, screenshot) dated today. Tomorrow-you can reproduce the step from that artifact without this paragraph.

## Day 27 — flutter test + one new unit test

**Work:** Tutorial 27.

Morning: read the tutorial without touching the keyboard. Write three questions. Afternoon: do the TASK. Evening: run the CHECKPOINT and paste the proof into your private notes file. If the checkpoint fails, do not start the next day — use Appendix D.

Reflection prompts: What object did you create today (table, widget, provider)? What would a student see if you shipped only through today? What secret did you almost put in git?

> **CHECKPOINT — Day 27 done**
> You have an artifact (file, query, screenshot) dated today. Tomorrow-you can reproduce the step from that artifact without this paragraph.

## Day 28 — Network tab on gradebook

**Work:** Tutorial 28.

Morning: read the tutorial without touching the keyboard. Write three questions. Afternoon: do the TASK. Evening: run the CHECKPOINT and paste the proof into your private notes file. If the checkpoint fails, do not start the next day — use Appendix D.

Reflection prompts: What object did you create today (table, widget, provider)? What would a student see if you shipped only through today? What secret did you almost put in git?

> **CHECKPOINT — Day 28 done**
> You have an artifact (file, query, screenshot) dated today. Tomorrow-you can reproduce the step from that artifact without this paragraph.

## Day 29 — Airplane mode marks

**Work:** Tutorial 29.

Morning: read the tutorial without touching the keyboard. Write three questions. Afternoon: do the TASK. Evening: run the CHECKPOINT and paste the proof into your private notes file. If the checkpoint fails, do not start the next day — use Appendix D.

Reflection prompts: What object did you create today (table, widget, provider)? What would a student see if you shipped only through today? What secret did you almost put in git?

> **CHECKPOINT — Day 29 done**
> You have an artifact (file, query, screenshot) dated today. Tomorrow-you can reproduce the step from that artifact without this paragraph.

# Day 30 — Release APK/web + password rotation plan

**Work:** Tutorial 30.

Morning: read the tutorial without touching the keyboard. Write three questions. Afternoon: do the TASK. Evening: run the CHECKPOINT and paste the proof into your private notes file. If the checkpoint fails, do not start the next day — use Appendix D.

Reflection prompts: What object did you create today (table, widget, provider)? What would a student see if you shipped only through today? What secret did you almost put in git?

> **CHECKPOINT — Day 30 done**
> You have an artifact (file, query, screenshot) dated today. Tomorrow-you can reproduce the step from that artifact without this paragraph.

# Oral exam — 50 questions with answers

Cover the answer. Speak for thirty seconds. Then read the book’s answer and grade yourself.

## Question 1

Why is profiles.id the Auth user id?

> **Model answer**
> RLS uses auth.uid(). If profile ids were random, every policy would need a join. Equality is simpler and harder to get wrong.

Follow-up you should also be able to answer: which file or SQL object proves this? If you cannot name one, you memorized a slogan, not the system.

## Question 2

Why synthetic emails?

> **Model answer**
> Supabase Auth signInWithPassword requires an email. The school wants usernames. auth_email is the adapter. The RPC hides the adapter from attackers probing disabled accounts.

Follow-up you should also be able to answer: which file or SQL object proves this? If you cannot name one, you memorized a slogan, not the system.

## Question 3

How do you prevent students from reading all marks?

> **Model answer**
> ENABLE ROW LEVEL SECURITY + SELECT policies that compare student_id to the caller’s students row (or teacher group membership, or is_admin). The Flutter list is not the control.

Follow-up you should also be able to answer: which file or SQL object proves this? If you cannot name one, you memorized a slogan, not the system.

## Question 4

What is the difference between students.id and profiles.id?

> **Model answer**
> profiles.id is the login identity. students.id is the roster identity used on attendance, marks, submissions, group_students. Mixing them yields empty joins.

Follow-up you should also be able to answer: which file or SQL object proves this? If you cannot name one, you memorized a slogan, not the system.

## Question 5

Why a junction table for group membership?

> **Model answer**
> A student can belong to more than one group (math and English). group_id on students cannot model that.

Follow-up you should also be able to answer: which file or SQL object proves this? If you cannot name one, you memorized a slogan, not the system.

### Question 6

Why does creating a group create a chat room?

> **Model answer**
> Trigger ensure_chat_room_for_group keeps a 1:1 invariant. Flutter must not insert chat_rooms ad hoc.

Follow-up you should also be able to answer: which file or SQL object proves this? If you cannot name one, you memorized a slogan, not the system.

### Question 7

How are unread counts computed?

> **Model answer**
> chat_unread_counts RPC, not a column on chat_rooms. Reads live in message_reads.

Follow-up you should also be able to answer: which file or SQL object proves this? If you cannot name one, you memorized a slogan, not the system.

### Question 8

Why REPLICA IDENTITY FULL on reactions?

> **Model answer**
> Realtime UPDATE/DELETE payloads need old keys. Default replica identity may omit them.

Follow-up you should also be able to answer: which file or SQL object proves this? If you cannot name one, you memorized a slogan, not the system.

### Question 9

Where is focus data?

> **Model answer**
> SharedPreferences. There is no focus table. Offline still works.

Follow-up you should also be able to answer: which file or SQL object proves this? If you cannot name one, you memorized a slogan, not the system.

### Question 10

How do four visual styles work?

> **Model answer**
> AppStyle enum + AppTheme.light/dark(style) + optional backdrops. Persisted as preferred_style.

Follow-up you should also be able to answer: which file or SQL object proves this? If you cannot name one, you memorized a slogan, not the system.

### Question 11

What happens if you skip first_admin_bootstrap?

> **Model answer**
> admin_create_user requires is_admin(). Chicken and egg. Bootstrap inserts the first admin like the RPC does.

Follow-up you should also be able to answer: which file or SQL object proves this? If you cannot name one, you memorized a slogan, not the system.

### Question 12

Why revoke seed_demo_data from authenticated?

> **Model answer**
> Otherwise any logged-in student could flood the school with fake users.

Follow-up you should also be able to answer: which file or SQL object proves this? If you cannot name one, you memorized a slogan, not the system.

### Question 13

How does language gating work?

> **Model answer**
> profiles.preferred_language null → router /language. After save, home opens.

Follow-up you should also be able to answer: which file or SQL object proves this? If you cannot name one, you memorized a slogan, not the system.

### Question 14

Why Duration.zero on theme animation?

> **Model answer**
> Styles do not interpolate cleanly. Instant switch is a product choice.

Follow-up you should also be able to answer: which file or SQL object proves this? If you cannot name one, you memorized a slogan, not the system.

### Question 15

What is a homework_pack?

> **Model answer**
> Assignment type with ordered tasks students submit. static is display-only.

Follow-up you should also be able to answer: which file or SQL object proves this? If you cannot name one, you memorized a slogan, not the system.

## Question 16

How are voice notes stored?

> **Model answer**
> record package → file → Storage chat-voices or submissions voice_url.

Follow-up you should also be able to answer: which file or SQL object proves this? If you cannot name one, you memorized a slogan, not the system.

## Question 17

How do credential slips work?

> **Model answer**
> Admin screen builds a PDF of usernames/passwords. Optional login_credentials table stores plaintext for reprint — treat as sensitive.

Follow-up you should also be able to answer: which file or SQL object proves this? If you cannot name one, you memorized a slogan, not the system.

## Question 18

What is academic_years_one_current?

> **Model answer**
> Partial unique index ensuring only one is_current year.

Follow-up you should also be able to answer: which file or SQL object proves this? If you cannot name one, you memorized a slogan, not the system.

## Question 19

Why maybeSingle on profile fetch?

> **Model answer**
> A signed-in Auth user might lack a profile (partial bootstrap). single() would throw.

Follow-up you should also be able to answer: which file or SQL object proves this? If you cannot name one, you memorized a slogan, not the system.

## Question 20

How do you test RLS?

> **Model answer**
> Two real JWTs (two app logins), never the SQL Editor postgres role.

Follow-up you should also be able to answer: which file or SQL object proves this? If you cannot name one, you memorized a slogan, not the system.

## Question 21

What does ShellRoute buy you?

> **Model answer**
> Persistent nav chrome while child routes change. One AppShell, three destination lists.

Follow-up you should also be able to answer: which file or SQL object proves this? If you cannot name one, you memorized a slogan, not the system.

### Question 22

Why invalidate profile after login?

> **Model answer**
> The FutureProvider may have cached null from the guest session.

Follow-up you should also be able to answer: which file or SQL object proves this? If you cannot name one, you memorized a slogan, not the system.

### Question 23

What is action_path on notifications?

> **Model answer**
> Deep link for go_router when the student taps the inbox row.

Follow-up you should also be able to answer: which file or SQL object proves this? If you cannot name one, you memorized a slogan, not the system.

### Question 24

Why jsonb for announcement files?

> **Model answer**
> Variable-length list of URLs without a child table. Trade-off: harder to query individual files.

Follow-up you should also be able to answer: which file or SQL object proves this? If you cannot name one, you memorized a slogan, not the system.

### Question 25

How is member_count defined?

> **Model answer**
> count(group_students)+1 for the teacher.

Follow-up you should also be able to answer: which file or SQL object proves this? If you cannot name one, you memorized a slogan, not the system.

### Question 26

What breaks if you use user_metadata.role in RLS?

> **Model answer**
> Users can edit user_metadata. They would escalate to admin.

Follow-up you should also be able to answer: which file or SQL object proves this? If you cannot name one, you memorized a slogan, not the system.

## Question 27

Why dart-define-from-file?

> **Model answer**
> Inject secrets at build/run without relying only on an asset .env.

Follow-up you should also be able to answer: which file or SQL object proves this? If you cannot name one, you memorized a slogan, not the system.

## Question 28

What is _sanitizeKey?

> **Model answer**
> Rejects placeholders and service-role-shaped keys so the app fails closed.

Follow-up you should also be able to answer: which file or SQL object proves this? If you cannot name one, you memorized a slogan, not the system.

## Question 29

How do you page assignments?

> **Model answer**
> PageResult + limit/offset or cursor in assignment providers + LoadMoreButton.

Follow-up you should also be able to answer: which file or SQL object proves this? If you cannot name one, you memorized a slogan, not the system.

## Question 30

What is the blast radius of deleting a teacher?

> **Model answer**
> ON DELETE CASCADE on groups.teacher_id removes groups and, cascading, assignments, chat, etc. Know this before delete UI.

Follow-up you should also be able to answer: which file or SQL object proves this? If you cannot name one, you memorized a slogan, not the system.

## Question 31

Why shared ChatRoomScreen?

> **Model answer**
> Behavior is identical; only basePath changes. Duplicating 1k lines three times is how bugs fork.

Follow-up you should also be able to answer: which file or SQL object proves this? If you cannot name one, you memorized a slogan, not the system.

## Question 32

How do replies stay in-room?

> **Model answer**
> chat_messages_reply_same_room trigger/function rejects cross-room reply_to.

Follow-up you should also be able to answer: which file or SQL object proves this? If you cannot name one, you memorized a slogan, not the system.

## Question 33

What is mark weight?

> **Model answer**
> Weighted average: sum(percentage*weight)/sum(weight). Views implement it.

Follow-up you should also be able to answer: which file or SQL object proves this? If you cannot name one, you memorized a slogan, not the system.

## Question 34

Why four academic terms?

> **Model answer**
> CHECK semester 1–4. Bounds come from academic_semester_bounds.

Follow-up you should also be able to answer: which file or SQL object proves this? If you cannot name one, you memorized a slogan, not the system.

## Question 35

How does mass generate work?

> **Model answer**
> admin_mass_generate_school_data SECURITY DEFINER after is_admin(). Dev/demo only on real schools.

Follow-up you should also be able to answer: which file or SQL object proves this? If you cannot name one, you memorized a slogan, not the system.

## Question 36

What is Nature Paper?

> **Model answer**
> An AppStyle with backdrop PNGs and paper décor widgets.

Follow-up you should also be able to answer: which file or SQL object proves this? If you cannot name one, you memorized a slogan, not the system.

## Question 37

How do you localize a new string?

> **Model answer**
> Add key to app_en.arb, app_ru.arb, app_uz.arb, flutter gen-l10n, use context.l10n.

Follow-up you should also be able to answer: which file or SQL object proves this? If you cannot name one, you memorized a slogan, not the system.

## Question 38

Why no Forgot password?

> **Model answer**
> Internal emails are not mailboxes. Admin resets via RPC.

Follow-up you should also be able to answer: which file or SQL object proves this? If you cannot name one, you memorized a slogan, not the system.

## Question 39

What is the web layout rule?

> **Model answer**
> Bottom bar on phones, rail on tablet/web widths. No permanent desktop-only sidebar.

Follow-up you should also be able to answer: which file or SQL object proves this? If you cannot name one, you memorized a slogan, not the system.

## Question 40

How do you know Realtime is live?

> **Model answer**
> Second device updates without refresh; publication includes the table.

Follow-up you should also be able to answer: which file or SQL object proves this? If you cannot name one, you memorized a slogan, not the system.

## Question 41

What is CacheService?

> **Model answer**
> SharedPreferences JSON for profile, assignments, notifications, dashboard when the network fails.

Follow-up you should also be able to answer: which file or SQL object proves this? If you cannot name one, you memorized a slogan, not the system.

## Question 42

Why publishable key vs service role?

> **Model answer**
> Publishable is designed for clients with RLS. Service role bypasses RLS and is a breach if shipped.

Follow-up you should also be able to answer: which file or SQL object proves this? If you cannot name one, you memorized a slogan, not the system.

## Question 43

How is a disabled user blocked?

> **Model answer**
> RPC filters is_disabled; router also sends /account-disabled if a profile loads as disabled.

Follow-up you should also be able to answer: which file or SQL object proves this? If you cannot name one, you memorized a slogan, not the system.

## Question 44

What file is the router?

> **Model answer**
> lib/core/router/app_router.dart

Follow-up you should also be able to answer: which file or SQL object proves this? If you cannot name one, you memorized a slogan, not the system.

## Question 45

Name three SECURITY DEFINER functions

> **Model answer**
> get_auth_email_by_username, admin_create_user, is_admin (and many admin_* / notify helpers).

Follow-up you should also be able to answer: which file or SQL object proves this? If you cannot name one, you memorized a slogan, not the system.

## Question 46

What unique key is on submissions?

> **Model answer**
> (task_id, student_id)

Follow-up you should also be able to answer: which file or SQL object proves this? If you cannot name one, you memorized a slogan, not the system.

## Question 47

What unique key is on attendance?

> **Model answer**
> (group_id, student_id, date) and (session_id, student_id)

Follow-up you should also be able to answer: which file or SQL object proves this? If you cannot name one, you memorized a slogan, not the system.

## Question 48

How do charts get data?

> **Model answer**
> Aggregates from marks/attendance views or provider-side grouping into Syncfusion series.

Follow-up you should also be able to answer: which file or SQL object proves this? If you cannot name one, you memorized a slogan, not the system.

## Question 49

What is go_router refreshListenable?

> **Model answer**
> _RouterNotifier that notifyListeners when auth or profile changes so redirect re-runs.

Follow-up you should also be able to answer: which file or SQL object proves this? If you cannot name one, you memorized a slogan, not the system.

## Question 50

Why include .env in assets?

> **Model answer**
> dotenv load on devices that are not using dart-define. Still gitignore the file contents in source control.

Follow-up you should also be able to answer: which file or SQL object proves this? If you cannot name one, you memorized a slogan, not the system.

# Generated localization Dart (reference)

These files are produced by flutter gen-l10n. Do not hand-edit. They are printed so you can see how an ARB key becomes a getter. If they are missing, run the generator.

## app_localizations.dart

**lib/l10n/app_localizations.dart**

```
import 'dart:async';

import 'package:flutter/foundation.dart';
import 'package:flutter/widgets.dart';
import 'package:flutter_localizations/flutter_localizations.dart';
import 'package:intl/intl.dart' as intl;

import 'app_localizations_en.dart';
import 'app_localizations_ru.dart';
import 'app_localizations_uz.dart';

// ignore_for_file: type=lint

/// Callers can lookup localized strings with an instance of AppLocalizations
/// returned by `AppLocalizations.of(context)`.
///
/// Applications need to include `AppLocalizations.delegate()` in their app's
/// `localizationDelegates` list, and the locales they support in the app's
/// `supportedLocales` list. For example:
///
/// ```dart
/// import 'l10n/app_localizations.dart';
///
/// return MaterialApp(
///   localizationsDelegates: AppLocalizations.localizationsDelegates,
///   supportedLocales: AppLocalizations.supportedLocales,
///   home: MyApplicationHome(),
/// );
/// ```
///
/// ## Update pubspec.yaml
///
/// Please make sure to update your pubspec.yaml to include the following
/// packages:
///
/// ```yaml
/// dependencies:
///   # Internationalization support.
///   flutter_localizations:
///     sdk: flutter
///   intl: any # Use the pinned version from flutter_localizations
///
///   # Rest of dependencies
/// ```
///
/// ## iOS Applications
///
/// iOS applications define key application metadata, including supported
/// locales, in an Info.plist file that is built into the application bundle.
/// To configure the locales supported by your app, you'll need to edit this
/// file.
///
/// First, open your project's ios/Runner.xcworkspace Xcode workspace file.
/// Then, in the Project Navigator, open the Info.plist file under the Runner
/// project's Runner folder.
///
/// Next, select the Information Property List item, select Add Item from the
/// Editor menu, then select Localizations from the pop-up menu.
///
/// Select and expand the newly-created Localizations item then, for each
/// locale your application supports, add a new item and select the locale
```

```
/// you wish to add from the pop-up menu in the Value field. This list should
/// be consistent with the languages listed in the AppLocalizations.supportedLocales
/// property.
abstract class AppLocalizations {
  AppLocalizations(String locale)
    : localeName = intl.Intl.canonicalizedLocale(locale.toString());

  final String localeName;

  static AppLocalizations of(BuildContext context) {
    return Localizations.of<AppLocalizations>(context, AppLocalizations)!;
  }

# Appendix A — Complete backend SQL

Run this script in the SQL Editor on a brand-new Supabase project, top to bottom. It is the recovered live schema (enums, tables, views, functions, triggers, grants). After it succeeds, run Appendix I to create the first admin. Then apply RLS from export/rls_policies.sql if the complete file's policy section is split.

**COMPLETE_BACKEND.sql**

```

# Appendix B — All dependencies explained

Versions are from pubspec.yaml at generation time. Run flutter pub get after edits. audioplayers_darwin is overridden to 6.3.0 for a platform resolution pin.

| Package | Version | Why MU Study needs it |
|---|---|---|
| supabase_flutter | ^2.9.1 | Auth, PostgREST, Storage, Realtime client |
| flutter_riverpod | ^2.6.1 | State: providers, notifiers, streams |
| go_router | ^14.8.1 | Path routing + redirects |
| freezed_annotation | ^2.4.4 | Available; models are hand-written today |
| json_annotation | ^4.9.0 | Optional codegen annotations |
| shared_preferences | ^2.5.3 | Theme, locale, focus, caches |
| responsive_framework | ^1.5.1 | Breakpoints for phone vs rail |
| flutter_animate | ^4.5.2 | Small motion on cards/emoji |
| cached_network_image | ^3.4.1 | Avatar and media decode cache |
| shimmer / skeletonizer | ^3 / ^2 | Loading placeholders |
| file_picker / image_picker | ^8 / ^1 | Homework and chat attachments |
| syncfusion_flutter_pdfviewer | ^30 | In-app PDF sheets |
| syncfusion_flutter_charts | ^30 | Teacher/admin analytics |
| syncfusion_flutter_pdf | ^30 | Credential slips + progress PDF |
| intl | ^0.20.2 | Dates; used with l10n |
| url_launcher | ^6.3.1 | Open assignment link_url |
| google_fonts | ^6.2.1 | Typography for styles |
| flutter_dotenv | ^5.2.1 | Load .env when dart-define absent |
| record / audioplayers | ^6 | Voice notes and playback |
| path_provider / path / cross_file | Local temp files for recordings | |
| share_plus | ^11 | Share progress/credential PDFs |
| video_player / get_thumbnail_video | Chat video | |
| http / crypto | Downloads and hashing helpers | |
| package_info_plus | ^9 | About / version on profile |
| lottie / characters | Animated emoji + grapheme safety | |
| flutter_cache_manager | ^3.4.2 | Custom cache stores for chat |
| flutter_localizations / cupertino_icons | SDK i18n + icons | |
| build_runner / freezed / json_serializable | dev — optional codegen | |
| flutter_lints / flutter_test | dev — analyze and tests | |

## What you do not depend on

- firebase_core / firebase_messaging — not used (Tutorial 20).
- provider / bloc — Riverpod only.

- auto_route — go_router only.

Videos teach the ecosystem. This book teaches MU Study. If a video shows email signup or Firebase, translate the idea; do not copy the architecture.

# Appendix D — Troubleshooting guide

| Symptom | Likely why | Diagnose | Fixed when |
|---|---|---|---|
| SetupRequiredScreen | Key empty/sanitized | Print Env after load; check eyJ/sb_publishable_ | Splash or login appears |
| Login always incorrect | RPC null, bad password, unconfirmed email | SELECT auth_email, is_disabled; Auth settings confirm email | Session exists |
| Bounces to login after sign-in | No profiles row | SELECT * FROM profiles WHERE id = auth user id | Profile loads |
| Stuck on /boot | Profile Future hanging | Network + RLS on profiles_select | Redirect to language or home |
| Stuck on /language | preferred_language null forever | Update failed RLS profiles_update_self | Column set; home opens |
| Empty assignment list | Wrong group or RLS | group_students membership; teacher_id | Rows appear |
| Save mark does nothing | UPDATE without SELECT policy | Add marks SELECT for teacher | Row percentage changes |
| Storage 403 | Path folders / policy | roomId and uid segments | Upload 200 |
| Realtime silent | Not in publication | supabase_realtime tables | Live insert shows |
| Chat under nav bar | extendBody / padding | shellContentBottomPadding | Timestamp visible |
| gen-l10n fails | Key missing in ru/uz | Diff ARB keys | flutter gen-l10n exits 0 |
| Nature Paper looks empty | Assets not copied | pubspec assets/images/nature-paper | Backdrop paints |
| Mic permission crash | Manifest/plist | RECORD_AUDIO + usage string | Record starts |
| Duplicate group title | unique (teacher_id, title) | Pick another title | Insert succeeds |
| Teacher create fails | sphere null | Pass math or english | teachers row exists |
| Student sees all marks | RLS off or service_role in app | Remove god key; enable RLS | Only own rows |
| Demo RPC callable | EXECUTE granted to anon | REVOKE from anon, authenticated | Permission denied |

## FAQ

**Can students register?** No. Admin creates accounts.

**Can I use Google login?** Not in this product. Username + password only.

**Where is Arabic?** Not shipped. Add a new ARB only as a new product decision.

**Where is FCM?** Not shipped. Inbox + Realtime is the notification system.

**Why @ in usernames?** Cosmetic. Email strips @ before @mustudy.internal.

# Appendix E — Architecture diagrams

## Data flow

**ascii**

```
 Widget  →  Riverpod  →  supabase.from / rpc / storage / channel
                                ↓
                        JWT + anon key
                                ↓
                  PostgREST / Auth / Storage / Realtime
                                ↓
                  PostgreSQL RLS + triggers + views
```

## Widget hierarchy (role session)

**ascii**

```
 MaterialApp.router
   ResponsiveBreakpoints
     NaturePaperBackdrop
       SoftNeumorphismBackdrop
         ShellRoute (AppShell + nav)
           Feature screen (dashboard, chat, …)
             Components (cards, lists)
```

## Provider dependencies (core)

**ascii**

```
 authStateProvider --> currentProfileProvider --> teacherProfileProvider
                   --> currentProfileProvider --> studentProfileProvider
                   --> routerProvider (refreshListenable)
 currentProfileProvider --> locale/theme applyFromProfile
 myGroupsProvider --> activeGroupId --> assignments / attendance / announcements
 chatRoomsProvider --> unreadChatCountProvider (shell badge)
 notificationsProvider --> unreadNotificationsCountProvider
```

## Database relationship sketch

**ascii**

```
 auth.users 1■■1 profiles 1■■0..1 teachers 1■■* groups 1■■1 chat_rooms
                 ■■0..1 students *■■* groups (group_students)
 groups 1■■* assignments 1■■* tasks 1■■* submissions
 groups 1■■* lesson_sessions 1■■* attendance
 groups 1■■* marks  (optional submissions.submission_id)
 groups 1■■* announcements     profiles 1■■* notifications
 chat_rooms 1■■* chat_messages 1■■* reads/reactions
 academic_years 1■■* academic_terms
```

# Appendix F — Code style guide

## Naming

- Files: snake_case.dart matching the main type (login_screen.dart).
- Widgets: PascalCase, private State with leading underscore.
- Providers: camelCase + Provider suffix (currentProfileProvider).
- JSON keys: snake_case matching Postgres.
- RPCs: snake_case matching SQL (get_auth_email_by_username).

## File organization

- Screens do not embed raw SQL strings; they call providers.
- Providers do not build widgets.
- Models do not import Flutter.
- Shared chat/profile live outside role folders.

## Comments

Comment why, not what. The router's note about /boot and semantics.parentDataDirty is the right kind of comment. Do not comment // increment counter.

## Best practices in this repo

1. maybeSingle when zero rows are valid.
2. if (!mounted) return after await in State.
3. l10n for every user-visible string.
4. Dispose channels and controllers.
5. Never log passwords or full JWTs.

# Appendix M — Full Column Catalog (Every Table)

Inspected from information_schema on the live MU Study Supabase database. Recreate every column with these nullability and default rules.

## Table public.academic_terms

| Column | Type | Null | Default | Notes |
|---|---|---|---|---|
| id | uuid | NO | gen_random_uuid() | PK |
| academic_year_id | uuid | NO | — | FK → academic_years.id CASCADE |
| semester | int4 | NO | — | 1–4 |
| starts_on | date | NO | — | |
| ends_on | date | NO | — | |

## Table public.academic_years

| Column | Type | Null | Default | Notes |
|---|---|---|---|---|
| id | uuid | NO | gen_random_uuid() | PK |
| start_year | int4 | NO | — | UNIQUE |
| label | text | NO | — | |
| is_current | bool | NO | false | partial unique one current |
| created_at | timestamptz | NO | now() | |
| created_by | uuid | YES | — | |

## Table public.announcements

| Column | Type | Null | Default | Notes |
|---|---|---|---|---|
| id | uuid | NO | gen_random_uuid() | PK |
| teacher_id | uuid | YES | — | FK teachers CASCADE; null for admin |
| group_id | uuid | NO | — | FK groups CASCADE |
| title | text | NO | — | |
| description | text | NO | '' | |
| image_urls | jsonb | NO | [] | |
| file_urls | jsonb | NO | [] | |
| created_at | timestamptz | NO | now() | |

## Table public.assignment_templates

| Column | Type | Null | Default | Notes |
|---|---|---|---|---|
| id | uuid | NO | gen_random_uuid() | PK |
| teacher_id | uuid | NO | — | FK teachers CASCADE |
| type | assignment_type | NO | static | |
| title | text | NO | — | |
| description | text | NO | '' | |
| tasks | jsonb | NO | [] | task drafts |
| created_at | timestamptz | NO | now() | |
| updated_at | timestamptz | NO | now() | |

## Table public.assignments

| Column | Type | Null | Default | Notes |
|---|---|---|---|---|
| id | uuid | NO | gen_random_uuid() | PK |
| teacher_id | uuid | NO | — | FK teachers CASCADE |
| group_id | uuid | NO | — | FK groups CASCADE |
| type | assignment_type | NO | static | static\|homework_pack |

## analysis_options.yaml

**analysis_options.yaml**

```
# This file configures the analyzer, which statically analyzes Dart code to
# check for errors, warnings, and lints.
#
# The issues identified by the analyzer are surfaced in the UI of Dart-enabled
# IDEs (https://dart.dev/tools#ides-and-editors). The analyzer can also be
# invoked from the command line by running `flutter analyze`.

# The following line activates a set of recommended lints for Flutter apps,
# packages, and plugins designed to encourage good coding practices.
include: package:flutter_lints/flutter.yaml

linter:
  # The lint rules applied to this project can be customized in the
  # section below to disable rules from the `package:flutter_lints/flutter.yaml`
  # included above or to enable additional rules. A list of all available lints
  # and their documentation is published at https://dart.dev/lints.
  #
  # Instead of disabling a lint rule for the entire project in the
  # section below, it can also be suppressed for a single line of code
  # or a specific dart file by using the `// ignore: name_of_lint` and
  # `// ignore_for_file: name_of_lint` syntax on the line or in the file
  # producing the lint.
  rules:
    # avoid_print: false  # Uncomment to disable the `avoid_print` rule
    # prefer_single_quotes: true  # Uncomment to enable the `prefer_single_quotes` rule

# Additional information about this file can be found at
# https://dart.dev/guides/language/analysis-options
```

# Appendix K — Glossary

| Term | Meaning in MU Study |
|---|---|
| anon / publishable key | Public client key. Safe to ship in the app if RLS is correct. Still do not post it in a public gist with your project URL if you can avoid it. |
| service_role key | Bypasses RLS. Server only. Never in Flutter. |
| auth.uid() | UUID of the signed-in user inside Postgres. |
| auth_email | Synthetic email on profiles, usually username@mustudy.internal. |
| RLS | Row Level Security — per-row SQL predicates Postgres applies automatically. |
| SECURITY DEFINER | Function runs as owner; must self-authorize. |
| PostgREST | HTTP API generated from Postgres tables and RPCs. |
| RPC | Remote Procedure Call — supabase.rpc('name', params). |
| JWT | Signed token proving a session. |
| ProviderScope | Riverpod root widget in main.dart. |
| ConsumerWidget | Widget that can watch Riverpod providers. |
| AsyncValue | Riverpod loading / error / data triad. |
| ShellRoute | go_router nest that keeps a navigation chrome while child routes change. |
| homework_pack | Assignment type that contains tasks students submit. |
| static assignment | Assignment type that is informational / display-only. |
| sphere | Teacher subject: math or english. |
| lesson_session | One group + one date; attendance rows hang off it. |
| chat_room_summaries | View joining rooms, group title, last message, member_count. |
| ARB | Application Resource Bundle — Flutter translation file. |
| AppStyle | modern \| naturePaper \| softNeumorphism \| monochromeWorkspace. |
| signed URL | Time-limited Storage download link for a private object. |
| replica identity FULL | Needed so Realtime UPDATE/DELETE payloads include old rows (reactions). |
| is_disabled | Soft-ban flag; login RPC hides the email. |
| preferred_language | en, ru, or uz stored on profiles. |
| Focus | Local study timer; not a database feature. |

# Extra practice quizzes

## Self-check quiz (cover the answers)

**Q1.** Why does login call an RPC instead of concatenating username + '@mustudy.internal' in Dart?

> **Answer 1**
> The RPC is the single source of truth, hides disabled users, and can change the email scheme without shipping a new app.

**Q2.** Why is profiles.id equal to auth.users.id?

> **Answer 2**
> So auth.uid() in RLS matches the profile primary key with no extra join.

**Q3.** What unique constraint stops two groups named Algebra A for the same teacher?

> **Answer 3**
> UNIQUE (teacher_id, title) / groups_teacher_title_uidx.

**Q4.** Why does member_count in chat_room_summaries add 1?

> **Answer 4**
> It counts group_students plus the teacher.

**Q5.** Which bucket is public?

> **Answer 5**
> avatars. Submissions, assignments, announcements, and chat-* are private.

**Q6.** Where is focus session state stored?

> **Answer 6**
> SharedPreferences via focusSessionProvider — no SQL table.

**Q7.** Name three SECURITY DEFINER functions an admin uses.

> **Answer 7**
> admin_create_user, admin_reset_password, admin_create_next_academic_year (and others in the atlas).

**Q8.** What happens if a student queries marks for the whole table?

> **Answer 8**
> RLS returns only rows they are allowed to see — typically their own.

**Q9.** Why themeAnimationDuration is Duration.zero?

**Answer 9**
Instant theme/style switches without interpolating incompatible palettes.

**Q10.** How do chat uploads prove the uploader?

**Answer 10**
Object path folder 2 must equal auth.uid(); storage policies enforce it.

## Table drill — academic_terms

Primary key column to remember: **id**. Count of documented columns: 5.

Write a SELECT that returns at most five rows from this table with the primary key and created_at if it exists. Then write the Flutter equivalent using .from().select().limit(5).

**CHECKPOINT — academic_terms independence**
In SQL Editor, run SELECT COUNT(*) FROM academic_terms; as a signed-in role you understand. If you are the anon role with no JWT, expect RLS to hide rows. That emptiness is success, not a broken table.

## Table drill — academic_years

Primary key column to remember: **id**. Count of documented columns: 6.

Write a SELECT that returns at most five rows from this table with the primary key and created_at if it exists. Then write the Flutter equivalent using .from().select().limit(5).

**CHECKPOINT — academic_years independence**
In SQL Editor, run SELECT COUNT(*) FROM academic_years; as a signed-in role you understand. If you are the anon role with no JWT, expect RLS to hide rows. That emptiness is success, not a broken table.

## Table drill — announcements

Primary key column to remember: **id**. Count of documented columns: 8.

Write a SELECT that returns at most five rows from this table with the primary key and created_at if it exists. Then write the Flutter equivalent using .from().select().limit(5).

**CHECKPOINT — announcements independence**
In SQL Editor, run SELECT COUNT(*) FROM announcements; as a signed-in role you understand. If you are the anon role with no JWT, expect RLS to hide rows. That emptiness is success, not a broken table.

## Table drill — assignment_templates

Primary key column to remember: **id**. Count of documented columns: 8.

Write a SELECT that returns at most five rows from this table with the primary key and created_at if it exists. Then write the Flutter equivalent using .from().select().limit(5).

> **CHECKPOINT — assignment_templates independence**
> In SQL Editor, run SELECT COUNT(*) FROM assignment_templates; as a signed-in role you understand. If you are the anon role with no JWT, expect RLS to hide rows. That emptiness is success, not a broken table.

### Table drill — assignments

Primary key column to remember: **id**. Count of documented columns: 8.

Write a SELECT that returns at most five rows from this table with the primary key and created_at if it exists. Then write the Flutter equivalent using .from().select().limit(5).

> **CHECKPOINT — assignments independence**
> In SQL Editor, run SELECT COUNT(*) FROM assignments; as a signed-in role you understand. If you are the anon role with no JWT, expect RLS to hide rows. That emptiness is success, not a broken table.

### Table drill — attendance

Primary key column to remember: **id**. Count of documented columns: 7.

Write a SELECT that returns at most five rows from this table with the primary key and created_at if it exists. Then write the Flutter equivalent using .from().select().limit(5).

> **CHECKPOINT — attendance independence**
> In SQL Editor, run SELECT COUNT(*) FROM attendance; as a signed-in role you understand. If you are the anon role with no JWT, expect RLS to hide rows. That emptiness is success, not a broken table.

### Table drill — chat_messages

Primary key column to remember: **id**. Count of documented columns: 10.

Write a SELECT that returns at most five rows from this table with the primary key and created_at if it exists. Then write the Flutter equivalent using .from().select().limit(5).

> **CHECKPOINT — chat_messages independence**
> In SQL Editor, run SELECT COUNT(*) FROM chat_messages; as a signed-in role you understand. If you are the anon role with no JWT, expect RLS to hide rows. That emptiness is success, not a broken table.

### Table drill — chat_rooms

Primary key column to remember: **id**. Count of documented columns: 3.

Write a SELECT that returns at most five rows from this table with the primary key and created_at if it exists. Then write the Flutter equivalent using .from().select().limit(5).

> **CHECKPOINT — chat_rooms independence**
> In SQL Editor, run SELECT COUNT(*) FROM chat_rooms; as a signed-in role you understand. If you are the anon role with no JWT, expect RLS to hide rows. That emptiness is success, not a broken table.

## Table drill — group_students

Primary key column to remember: **id**. Count of documented columns: 4.

Write a SELECT that returns at most five rows from this table with the primary key and created_at if it exists. Then write the Flutter equivalent using .from().select().limit(5).

> **CHECKPOINT — group_students independence**
> In SQL Editor, run SELECT COUNT(*) FROM group_students; as a signed-in role you understand. If you are the anon role with no JWT, expect RLS to hide rows. That emptiness is success, not a broken table.

## Table drill — groups

Primary key column to remember: **id**. Count of documented columns: 4.

Write a SELECT that returns at most five rows from this table with the primary key and created_at if it exists. Then write the Flutter equivalent using .from().select().limit(5).

> **CHECKPOINT — groups independence**
> In SQL Editor, run SELECT COUNT(*) FROM groups; as a signed-in role you understand. If you are the anon role with no JWT, expect RLS to hide rows. That emptiness is success, not a broken table.

## Table drill — lesson_sessions

Primary key column to remember: **id**. Count of documented columns: 4.

Write a SELECT that returns at most five rows from this table with the primary key and created_at if it exists. Then write the Flutter equivalent using .from().select().limit(5).

> **CHECKPOINT — lesson_sessions independence**
> In SQL Editor, run SELECT COUNT(*) FROM lesson_sessions; as a signed-in role you understand. If you are the anon role with no JWT, expect RLS to hide rows. That emptiness is success, not a broken table.

## Table drill — marks

Primary key column to remember: **id**. Count of documented columns: 13.

Write a SELECT that returns at most five rows from this table with the primary key and created_at if it exists. Then write the Flutter equivalent using .from().select().limit(5).

> **CHECKPOINT — marks independence**
> In SQL Editor, run SELECT COUNT(*) FROM marks; as a signed-in role you understand. If you are the anon role with no JWT, expect RLS to hide rows. That emptiness is success, not a broken table.

## Table drill — message_reactions

Primary key column to remember: **id**. Count of documented columns: 5.

Write a SELECT that returns at most five rows from this table with the primary key and created_at if it exists. Then write the Flutter equivalent using .from().select().limit(5).

**CHECKPOINT — message_reactions independence**
In SQL Editor, run SELECT COUNT(*) FROM message_reactions; as a signed-in role you understand. If you are the anon role with no JWT, expect RLS to hide rows. That emptiness is success, not a broken table.

## Table drill — message_reads

Primary key column to remember: **id**. Count of documented columns: 4.

Write a SELECT that returns at most five rows from this table with the primary key and created_at if it exists. Then write the Flutter equivalent using .from().select().limit(5).

**CHECKPOINT — message_reads independence**
In SQL Editor, run SELECT COUNT(*) FROM message_reads; as a signed-in role you understand. If you are the anon role with no JWT, expect RLS to hide rows. That emptiness is success, not a broken table.

## Table drill — notifications

Primary key column to remember: **id**. Count of documented columns: 9.

Write a SELECT that returns at most five rows from this table with the primary key and created_at if it exists. Then write the Flutter equivalent using .from().select().limit(5).

**CHECKPOINT — notifications independence**
In SQL Editor, run SELECT COUNT(*) FROM notifications; as a signed-in role you understand. If you are the anon role with no JWT, expect RLS to hide rows. That emptiness is success, not a broken table.

## Table drill — profiles

Primary key column to remember: **id**. Count of documented columns: 11.

Write a SELECT that returns at most five rows from this table with the primary key and created_at if it exists. Then write the Flutter equivalent using .from().select().limit(5).

**CHECKPOINT — profiles independence**
In SQL Editor, run SELECT COUNT(*) FROM profiles; as a signed-in role you understand. If you are the anon role with no JWT, expect RLS to hide rows. That emptiness is success, not a broken table.

## Table drill — students

Primary key column to remember: **id**. Count of documented columns: 3.

Write a SELECT that returns at most five rows from this table with the primary key and created_at if it exists. Then write the Flutter equivalent using .from().select().limit(5).

**CHECKPOINT — students independence**
In SQL Editor, run SELECT COUNT(*) FROM students; as a signed-in role you understand. If you are the anon role with no JWT, expect RLS to hide rows. That emptiness is success, not a broken table.

## Table drill — submissions

Primary key column to remember: **id**. Count of documented columns: 11.

Write a SELECT that returns at most five rows from this table with the primary key and created_at if it exists. Then write the Flutter equivalent using .from().select().limit(5).

> **CHECKPOINT — submissions independence**
> In SQL Editor, run SELECT COUNT(*) FROM submissions; as a signed-in role you understand. If you are the anon role with no JWT, expect RLS to hide rows. That emptiness is success, not a broken table.

## Table drill — tasks

Primary key column to remember: **id**. Count of documented columns: 8.

Write a SELECT that returns at most five rows from this table with the primary key and created_at if it exists. Then write the Flutter equivalent using .from().select().limit(5).

> **CHECKPOINT — tasks independence**
> In SQL Editor, run SELECT COUNT(*) FROM tasks; as a signed-in role you understand. If you are the anon role with no JWT, expect RLS to hide rows. That emptiness is success, not a broken table.

## Table drill — teachers

Primary key column to remember: **id**. Count of documented columns: 4.

Write a SELECT that returns at most five rows from this table with the primary key and created_at if it exists. Then write the Flutter equivalent using .from().select().limit(5).

> **CHECKPOINT — teachers independence**
> In SQL Editor, run SELECT COUNT(*) FROM teachers; as a signed-in role you understand. If you are the anon role with no JWT, expect RLS to hide rows. That emptiness is success, not a broken table.

# Appendix L — Foundation essays

These essays are slow explanations of ideas the tutorials assume. Read them when a tutorial feels like it skipped a year of computer science. They are written against MU Study, not a generic blog.

## How a tap becomes a database row

A student taps Submit on a homework task. Flutter builds a gesture, the screen calls a Riverpod notifier, the notifier calls supabase.from('submissions').upsert(...). That HTTP request hits PostgREST on your Supabase project with the user's JWT. Postgres checks RLS. If the student owns the student_id and belongs to the group, the row is written. A trigger may insert notifications for the teacher. Realtime notifies subscribed clients. The teacher's submissions list rebuilds.

If any layer lies — a forged student_id, a missing JWT, a policy that uses user_metadata — the system is unsafe. MU Study keeps authorization in Postgres helpers (is_admin, is_teacher_of_group, is_student_in_group) so the Flutter client is not the security boundary.

Practice: pick one button in the running app and write this chain on paper: widget → provider → table/RPC → policy → trigger → UI refresh.

## HTTP, JSON, and PostgREST

Supabase’s Data API is PostgREST: your table names become URL paths. GET /rest/v1/assignments?group_id=eq. is what .from('assignments').select().eq('group_id', id) becomes. The Flutter SDK hides the HTTP, but you should still think in requests: method, headers (apikey, Authorization: Bearer ), and JSON body.

JSON objects use snake_case column names from Postgres. Dart models convert to camelCase (full_name → fullName). If you forget the mapping, fromJson throws or shows empty names. That is a model bug, not a database bug.

Errors arrive as PostgrestException with a message and often a Postgres code (42501 insufficient privilege for RLS denials that surface as empty results, 23505 unique violation, 23503 foreign key).

## JWT sessions without mysticism

After signInWithPassword, Supabase returns an access token (JWT) and a refresh token. The access token is a signed JSON object: subject (user id), expiry, role authenticated. Every .from() call sends that token. RLS reads auth.uid() from it.

MU Study does not invent emails in the client. It asks get_auth_email_by_username for the synthetic address stored on profiles.auth_email. Disabled users get NULL, so login fails the same way as a wrong password — no account-enumeration toast.

Deleting a user in the dashboard does not instantly kill an already-issued JWT. For school software, keep sessions reasonably short and disable profiles (is_disabled) so the RPC and policies stop the account even if a token still exists.

## Postgres types used in MU Study

uuid — primary keys, generated with gen_random_uuid(). Never use serial integers for public IDs in this project; the live schema is UUID throughout.

text — usernames, titles, bodies. Prefer text over varchar unless you have a length rule.

timestamptz — created_at, due_date, submitted_at. Always timezone-aware.

date — attendance.date, lesson_sessions.session_date, marks.marked_on.

boolean — is_disabled, is_read, is_deleted, is_current, is_completed.

numeric — marks.percentage (0–100), marks.weight (>0), submissions.score.

jsonb — announcement image_urls/file_urls, assignment_templates.tasks.

enums — user_role, sphere_type, assignment_type, attendance_status, submission_status, chat_message_type, mark_category. Changing an enum in production requires ALTER TYPE; plan names carefully.

## Git hygiene for a school app

.env is gitignored. If you accidentally commit a key, rotate it in Supabase (Settings → API) and treat the old key as public.

Do not commit service_role. Do not commit printed password PDFs from Admin → Credentials.

Demo passwords such as password123 are for throwaway local projects only. The README says every account including @admin must get a real password before anyone outside the team can reach the instance.

Prefer small commits that match a tutorial checkpoint: “add login RPC wiring”, not “stuff”.

## Widget trees and rebuilds

Flutter rebuilds widgets when an ancestor setState or a watched provider changes. A ConsumerWidget that watches currentProfileProvider rebuilds when the profile Future completes. A StatelessWidget that only receives a Profile as a constructor argument rebuilds only when its parent rebuilds.

MU Study uses themeAnimationDuration: Duration.zero so style switches do not animate through a muddy blend. That is a product choice, not a Flutter default.

Heavy lists (chat, gradebook) should not rebuild the entire shell. Providers are scoped so a new message does not re-fetch academic years.

## Security principles encoded in this repo

Authorization data lives in profiles.role and teachers/students tables, not in editable user_metadata. RLS and RPCs read those tables (or auth.uid()).

Views that join sensitive rows must be treated carefully. chat_room_summaries is only safe if the underlying tables are RLS-protected and the view is not a security-definer leak. Prefer security_invoker views on modern Postgres.

Storage paths encode roomId and profileId. Policies parse the object name. A client that uploads to someone else's folder must 403.

seed_demo_data and _demo_insert_user are development scaffolding. EXECUTE is revoked from anon and authenticated on a hardened project.

## How teachers and groups actually work

Creating a teacher does not create Group 1/2/3. Admins type exact group titles under Admin → Groups. A unique index (teacher_id, title) prevents duplicate names for the same teacher.

Inserting a group fires ensure_chat_room_for_group so a 1:1 chat_rooms row exists. Students appear in chat only after group_students membership.

Teachers have a required sphere: math or english. The admin_create_user RPC raises 'Sphere required for teacher' if it is missing.

## Homework packs versus static assignments

assignment_type is static or homework_pack. Static assignments are display-only in the student app (announcement-like work). Homework packs contain ordered tasks. Students open a pack, then a task, then submit text, file, and/or voice.

One submission per (task_id, student_id). Teachers review in the submissions queue and may write score + feedback. A trigger can sync a mark row.

Teachers can save assignment_templates as JSON drafts and reuse them.

## Focus mode is local

Student Focus is a Pomodoro or free-count timer stored in SharedPreferences. There is no focus_sessions table. Chat badges can be muted during a session while notifications still arrive in the inbox table.

This is a good example of not putting every UX idea in Postgres. If the phone is offline, focus still works.
